- Arc::MCC_Status **CacheLink** (Arc::XMLNode in, Arc::XMLNode out, const **JobUser** &user, const Arc::User &mapped_user)

6.9.1 Detailed Description

CacheService (p. 23) provides functionality for A-REX cache operations that can be performed by remote clients. It currently consists of two operations: **CacheCheck** - allows querying of the cache for the presence of files. **CacheLink** - enables a running job to dynamically request cache files to be linked to its working (session) directory. This is especially useful in the case of pilot job workflows where job submission does not follow the usual ARC workflow. In order for input files to be available to jobs, the pilot job can call the cache service to prepare them. If requested files are not present in the cache, they can be downloaded by the cache service if requested, using the A-REX downloader utility.

6.9.2 Constructor & Destructor Documentation

6.9.2.1 Cache::CacheService::CacheService (Arc::Config * cfg)

Make a new **CacheService** (p. 23). Reads the configuration and determines the validity of the service.

6.9.2.2 virtual Cache::CacheService::~~CacheService (void) [virtual]

6.9.3 Member Function Documentation

6.9.3.1 **Arc::MCC_Status Cache::CacheService::CacheCheck (Arc::XMLNode *in*, Arc::XMLNode *out*, const JobUser & *user*)** [protected]

Check whether the URLs supplied in the input are present in any cache. Returns in the out message for each file true or false, and if true, the size of the file on cache disk.

Parameters

<i>user</i>	A-REX user configuration for the mapped user
-------------	--

6.9.3.2 **Arc::MCC_Status Cache::CacheService::CacheLink (Arc::XMLNode *in*, Arc::XMLNode *out*, const JobUser & *user*, const Arc::User & *mapped_user*)** [protected]

This method is used to link cache files to the session dir. A list of URLs is supplied and if they are present in the cache and the user calling the service has permission to access them, then they are linked to the given session directory. If the user requests that missing files be staged, then a downloader process is launched to obtain them.

Parameters

<i>user</i>	A-REX user configuration for the mapped user
<i>mapped_user</i>	The local user to which the client DN was mapped

6.9.3.3 **Cache::CacheService::operator bool (void)** [inline]

Returns true if the **CacheService** (p. 23) is valid.

6.9.3.4 **bool Cache::CacheService::operator! (void)** [inline]

Returns true if the **CacheService** (p. 23) is not valid.

6.9.3.5 **virtual Arc::MCC_Status Cache::CacheService::process (Arc::Message & *inmsg*, Arc::Message & *outmsg*)** [virtual]

Main method called by HED when **CacheService** (p. 23) is invoked. Directs call to appropriate **CacheService** (p. 23) method.

6.9.3.6 **bool Cache::CacheService::RegistrationCollector (Arc::XMLNode & *doc*)**

Supplies information on the service for use in the information system.

Returns

0 if file exists, 1 if it is not a proper file or other error, 2 if the file not there yet

6.26.3.3 bool DTRGenerator::queryJobFinished (JobDescription & job)

Query status of DTRs in job. If all DTRs are finished, returns true, otherwise returns false. If true is returned, the **JobDescription** (p. 43) should be checked for whether the staging was successful or not by checking GetFailure().

Parameters

<i>job</i>	Description of job to query. Can be modified to add a failure reason.
------------	---

Returns

True if all DTRs in the job are finished, false otherwise.

6.26.3.4 virtual void DTRGenerator::receiveDTR (DataStaging::DTR & *dtr*) [virtual]

Parameters

<i>dtr</i>	DTR object sent back from the Scheduler
------------	---

6.26.3.5 void DTRGenerator::receiveJob (const JobDescription & *job*)

- **operator bool** (void)
- bool **operator!** (void)
- bool **deploy** (void)
- bool **remove** (void)
- bool **wait** (int timeout)
- Result **result** (void)

6.52.1 Detailed Description

Class to communicate with **Janitor** (p. 41) - Dynmaic Runtime Environment handler.

6.52.2 Constructor & Destructor Documentation

6.52.2.1 Janitor::Janitor (const std::string & *id*, const std::string & *cdir*, const GMEEnvironment & *env*)

Creates instance representing job entry in **Janitor** (p. 41) database.

Takes *id* for job identifier and *cdir* for the control directory of A-Rex. constructor does not register job in the **Janitor** (p. 41). It only associates job with this instance.

6.52.3 Member Function Documentation

6.52.3.1 bool Janitor::deploy (void)

Registers associated job with **Janitor** (p. 41) and deploys dynamic RTEs.

This operation is asynchronous. Returned true means **Janitor** (p. 41) will be contacted and deployment will start soon. For obtaining result of operation see methods **wait()** (p. 42) and **result()** (p. 42). During this operation janitor utility is called with command register and optionally deploy.

6.52.3.2 bool Janitor::remove (void)

Removes job from those handled by **Janitor** (p. 41) and releases associated RTEs.

This operation is asynchronous. Returned true means **Janitor** (p. 41) will be contacted and removal will start soon. For obtaining result of operation see methods **wait()** (p. 42) and **result()** (p. 42). During this operation janitor utility is called with command remove.

6.52.3.3 Result Janitor::result (void)

Returns true if operation initiated by **deploy()** (p. 42) or **remove()** (p. 42) succeeded.

It should be called after **wait()** (p. 42) returned true.

6.52.3.4 bool Janitor::wait (int *timeout*)

Wait till operation initiated by **deploy()** (p. 42) or **remove()** (p. 42) finished.

This operation returns true if operation finished or false if timeout seconds passed. It may be called repeatedly and even after it previously returned true. If no operation is running it returns true immediately.

6.99.1 Detailed Description

A Service which signs the short-lived certificate; it accepts the certificate signing request (CSR) from client side through soap, signs a short-lived certificate and sends back through soap. This service is supposed to be deployed together with the SPService and saml2sso.serviceprovider handler, in order to sign certificate based on the authentication result from saml2sso profile. Also the saml attribute (inside the saml assertion from saml2sso profile) will be put into the signed short-lived certificate. By deploying this service together with SPService and saml2sso.serviceprovider handler, we can get the conversion from username/password -----> x509 certificate.
