# Chapter 1

## KnowARC Namespace Index

### 1.1 KnowARC Namespace List

Here is a list of all documented namespaces with brief descriptions:

<a href="#">Arc</a> .....	7
---------------------------	---

## Chapter 2

# KnowARC Hierarchical Index

### 2.1 KnowARC Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

Arc::AttributeIterator . . . . .	19
Arc::ChainContext . . . . .	23
Arc::Counter . . . . .	26
Arc::IntraProcessCounter . . . . .	44
Arc::CounterTicket . . . . .	33
Arc::ExpirationReminder . . . . .	35
Arc::InformationInterface . . . . .	39
Arc::InformationContainer . . . . .	37
Arc::InformationRequest . . . . .	41
Arc::InformationResponse . . . . .	43
Arc::Loader . . . . .	48
Arc::loader_descriptor . . . . .	50
Arc::LogDestination . . . . .	53
Arc::LogStream . . . . .	59
Arc::Logger . . . . .	54
Arc::LogMessage . . . . .	57
mcc_descriptor . . . . .	64
Arc::MCC_Status . . . . .	65
Arc::MCCInterface . . . . .	69
Arc::MCC . . . . .	61
Arc::Plexer . . . . .	96
Arc::Service . . . . .	102
Arc::Message . . . . .	70
Arc::MessageAttributes . . . . .	72
Arc::MessageAuth . . . . .	75
Arc::MessageContext . . . . .	76
Arc::MessageContextElement . . . . .	77
Arc::MessagePayload . . . . .	78
Arc::PayloadRawInterface . . . . .	83
Arc::PayloadRaw . . . . .	80
Arc::PayloadSOAP . . . . .	85
Arc::PayloadStreamInterface . . . . .	89

Arc::PayloadStream . . . . .	86
Arc::PayloadWSRF . . . . .	92
Arc::ModuleManager . . . . .	79
Arc::LoaderFactory . . . . .	51
Arc::MCCFactory . . . . .	68
Arc::PDPFactory . . . . .	95
Arc::SecHandlerFactory . . . . .	101
Arc::ServiceFactory . . . . .	105
pdp_descriptor . . . . .	94
Arc::PlexerEntry . . . . .	98
Arc::RegularExpression . . . . .	99
service_descriptor . . . . .	104
Arc::SimpleCondition . . . . .	106
Arc::SOAPFault . . . . .	110
Arc::SOAPMessage . . . . .	113
Arc::Time . . . . .	115
Arc::URL . . . . .	118
Arc::URLLocation . . . . .	124
Arc::WSAEndpointReference . . . . .	126
Arc::WSAHeader . . . . .	128
Arc::WSRF . . . . .	131
Arc::WSRFBBaseFault . . . . .	133
Arc::WSRPFault . . . . .	137
Arc::WSRPResourcePropertyChangeFailure . . . . .	138
Arc::WSRP . . . . .	135
Arc::XMLNode . . . . .	139
Arc::Config . . . . .	24
Arc::SOAPEnvelope . . . . .	108
Arc::PayloadSOAP . . . . .	85

## Chapter 3

# KnowARC Class Index

### 3.1 KnowARC Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

<a href="#">Arc::AttributeIterator</a> (An iterator class for accessing multiple values of an attribute ) . . . . .	19
<a href="#">Arc::ChainContext</a> (Interface to chain specific functionality ) . . . . .	23
<a href="#">Arc::Config</a> (Configuration element - represents (sub)tree of ARC configuration ) . . . . .	24
<a href="#">Arc::Counter</a> (A class defining a common interface for counters ) . . . . .	26
<a href="#">Arc::CounterTicket</a> (A class for "tickets" that correspond to counter reservations ) . . . . .	33
<a href="#">Arc::ExpirationReminder</a> (A class intended for internal use within counters ) . . . . .	35
<a href="#">Arc::InformationContainer</a> (Information System document container and processor ) . . . . .	37
<a href="#">Arc::InformationInterface</a> (Information System message processor ) . . . . .	39
<a href="#">Arc::InformationRequest</a> (Request for information in InfoSystem ) . . . . .	41
<a href="#">Arc::InformationResponse</a> (Informational response from InfoSystem ) . . . . .	43
<a href="#">Arc::IntraProcessCounter</a> (A class for counters used by threads within a single process ) . . . . .	44
<a href="#">Arc::Loader</a> (Creator of <a href="#">Message</a> Component Chains ( <a href="#">MCC</a> ) ) . . . . .	48
<a href="#">Arc::loader_descriptor</a> (Identifier of plugin ) . . . . .	50
<a href="#">Arc::LoaderFactory</a> (Plugin handler ) . . . . .	51
<a href="#">Arc::LogDestination</a> (A base class for log destinations ) . . . . .	53
<a href="#">Arc::Logger</a> (A logger class ) . . . . .	54
<a href="#">Arc::LogMessage</a> (A class for log messages ) . . . . .	57
<a href="#">Arc::LogStream</a> (A class for logging to ostreams ) . . . . .	59
<a href="#">Arc::MCC</a> ( <a href="#">Message</a> Chain Component - base class for every <a href="#">MCC</a> plugin ) . . . . .	61
<a href="#">mcc_descriptor</a> (Identifier of Message Chain Component ( <a href="#">MCC</a> ) plugin ) . . . . .	64
<a href="#">Arc::MCC_Status</a> (A class for communication of <a href="#">MCC</a> processing results ) . . . . .	65
<a href="#">Arc::MCCFactory</a> ( <a href="#">MCC</a> Plugins handler ) . . . . .	68
<a href="#">Arc::MCCInterface</a> (Interface for communication between <a href="#">MCC</a> , <a href="#">Service</a> and <a href="#">Plexer</a> objects ) . . . . .	69
<a href="#">Arc::Message</a> (Object being passed through chain of <a href="#">MCC</a> s ) . . . . .	70
<a href="#">Arc::MessageAttributes</a> (A class for storage of attribute values ) . . . . .	72
<a href="#">Arc::MessageAuth</a> (Contains authenticity information, authorization tokens and decisions ) . . . . .	75
<a href="#">Arc::MessageContext</a> (Handler for context of message context ) . . . . .	76
<a href="#">Arc::MessageContextElement</a> (Top class for elements contained in message context ) . . . . .	77
<a href="#">Arc::MessagePayload</a> (Base class for content of message passed through chain ) . . . . .	78
<a href="#">Arc::ModuleManager</a> (Manager of shared libraries ) . . . . .	79
<a href="#">Arc::PayloadRaw</a> (Raw byte multi-buffer ) . . . . .	80
<a href="#">Arc::PayloadRawInterface</a> (Random Access Payload for <a href="#">Message</a> objects ) . . . . .	83
<a href="#">Arc::PayloadSOAP</a> (Payload of <a href="#">Message</a> with SOAP content ) . . . . .	85

<a href="#">Arc::PayloadStream</a> (POSIX handle as Payload ) . . . . .	86
<a href="#">Arc::PayloadStreamInterface</a> (Stream-like Payload for <a href="#">Message</a> object ) . . . . .	89
<a href="#">Arc::PayloadWSRF</a> (This class combines <a href="#">MessagePayload</a> with <a href="#">WSRF</a> ) . . . . .	92
<a href="#">pdp_descriptor</a> (Identifier of Policy Decision Point (PDP) plugin ) . . . . .	94
<a href="#">Arc::PDPFactory</a> (PDP Plugins handler ) . . . . .	95
<a href="#">Arc::Plexer</a> (The <a href="#">Plexer</a> class, used for routing messages to services ) . . . . .	96
<a href="#">Arc::PlexerEntry</a> (A pair of label (regex) and pointer to service ) . . . . .	98
<a href="#">Arc::RegularExpression</a> (A regular expression class ) . . . . .	99
<a href="#">Arc::SecHandlerFactory</a> (SecHandler Plugins handler ) . . . . .	101
<a href="#">Arc::Service</a> ( <a href="#">Service</a> - last component in a <a href="#">Message</a> Chain ) . . . . .	102
<a href="#">service_descriptor</a> (Identifier of Service plugin ) . . . . .	104
<a href="#">Arc::ServiceFactory</a> ( <a href="#">Service</a> Plugins handler ) . . . . .	105
<a href="#">Arc::SimpleCondition</a> (Simple triggered condition ) . . . . .	106
<a href="#">Arc::SOAPEnvelope</a> (Extends <a href="#">XMLNode</a> class to support structures of SOAP message ) . . . . .	108
<a href="#">Arc::SOAPFault</a> (Interface to SOAP Fault message ) . . . . .	110
<a href="#">Arc::SOAPMessage</a> ( <a href="#">Message</a> restricted to SOAP payload ) . . . . .	113
<a href="#">Arc::Time</a> (A class for storing and manipulating times ) . . . . .	115
<a href="#">Arc::URL</a> (Class to hold general URL's ) . . . . .	118
<a href="#">Arc::URLLocation</a> (Class to hold a resolved <a href="#">URL</a> location ) . . . . .	124
<a href="#">Arc::WSAEndpointReference</a> (Interface for manipulation of WS-Adressing Endpoint Reference ) . . . . .	126
<a href="#">Arc::WSAHeader</a> (Interface for manipulation WS-Addressing information in SOAP header ) . . . . .	128
<a href="#">Arc::WSRF</a> (Base class for every <a href="#">WSRF</a> message ) . . . . .	131
<a href="#">Arc::WSRFBaseFault</a> (Base class for <a href="#">WSRF</a> fault messages ) . . . . .	133
<a href="#">Arc::WSRP</a> (Base class for WS-ResourceProperties structures ) . . . . .	135
<a href="#">Arc::WSRPFault</a> (Base class for WS-ResourceProperties faults ) . . . . .	137
<a href="#">Arc::WSRPResourcePropertyChangeFailure</a> . . . . .	138
<a href="#">Arc::XMLNode</a> (Wrapper for LibXML library Tree interface ) . . . . .	139

## Chapter 4

# KnowARC Namespace Documentation

### 4.1 Arc Namespace Reference

#### Classes

- class [Config](#)  
*Configuration element - represents (sub)tree of ARC configuration.*
- struct **xsd\_\_hexBinary**
- struct **xsd\_\_base64Binary**
- class **BasicType**
- class **String**
- class **Boolean**
- class **Float**
- class **Double**
- class **Decimal**
- class **Duration**
- class **DateTime**
- class **AnyURI**
- class **QName**
- class **NOTATION**
- class **NormalizedString**
- class **Token**
- class **Language**
- class **IDREFS**
- class **ENTITIES**
- class **NMTOKEN**
- class **NMTOKENS**
- class **Name**
- class **NCName**
- class **ID**
- class **IDREF**
- class **ENTITY**
- class **Integer**
- class **NonPositiveInteger**

- class **NegativeInteger**
- class **Long**
- class [Time](#)  
*A class for storing and manipulating times.*
- class **Period**
- class [LogMessage](#)  
*A class for log messages.*
- class [LogDestination](#)  
*A base class for log destinations.*
- class [LogStream](#)  
*A class for logging to ostreams.*
- class [Logger](#)  
*A logger class.*
- class [SimpleCondition](#)  
*Simple triggered condition.*
- class [URL](#)  
*Class to hold general URL's.*
- class [URLLocation](#)  
*Class to hold a resolved [URL](#) location.*
- class [XMLNode](#)  
*Wrapper for LibXML library Tree interface.*
- class [Counter](#)  
*A class defining a common interface for counters.*
- class [CounterTicket](#)  
*A class for "tickets" that correspond to counter reservations.*
- class [ExpirationReminder](#)  
*A class intended for internal use within counters.*
- class [IntraProcessCounter](#)  
*A class for counters used by threads within a single process.*
- class [InformationInterface](#)  
*Information System message processor.*
- class [InformationContainer](#)  
*Information System document container and processor.*
- class [InformationRequest](#)  
*Request for information in InfoSystem.*

- class [InformationResponse](#)  
*Informational response from InfoSystem.*
- class [Loader](#)  
*Creator of [Message](#) Component Chains ([MCC](#)).*
- class [ChainContext](#)  
*Interface to chain specific functionality.*
- struct [loader\\_descriptor](#)  
*Identifier of plugin.*
- class [LoaderFactory](#)  
*Plugin handler.*
- class [MCCFactory](#)  
*[MCC](#) Plugins handler.*
- class [ModuleManager](#)  
*Manager of shared libraries.*
- class [PDPFactory](#)  
*PDP Plugins handler.*
- class [RegularExpression](#)  
*A regular expression class.*
- class [PlexerEntry](#)  
*A pair of label (regex) and pointer to service.*
- class [Plexer](#)  
*The [Plexer](#) class, used for routing messages to services.*
- class [SecHandlerFactory](#)  
*SecHandler Plugins handler.*
- class [ServiceFactory](#)  
*[Service](#) Plugins handler.*
- class [MCCInterface](#)  
*Interface for communication between [MCC](#), [Service](#) and [Plexer](#) objects.*
- class [MCC](#)  
*[Message](#) Chain Component - base class for every [MCC](#) plugin.*
- class [MCC\\_Status](#)  
*A class for communication of [MCC](#) processing results.*
- class [MessagePayload](#)

*Base class for content of message passed through chain.*

- class [MessageContextElement](#)  
*Top class for elements contained in message context.*
- class [MessageContext](#)  
*Handler for context of message context.*
- class [Message](#)  
*Object being passed through chain of MCCs.*
- class [AttributeIterator](#)  
*An iterator class for accessing multiple values of an attribute.*
- class [MessageAttributes](#)  
*A class for storage of attribute values.*
- class [MessageAuth](#)  
*Contains authenticity information, authorization tokens and decisions.*
- class [PayloadRawInterface](#)  
*Random Access Payload for [Message](#) objects.*
- struct **PayloadRawBuf**
- class [PayloadRaw](#)  
*Raw byte multi-buffer.*
- class [PayloadSOAP](#)  
*Payload of [Message](#) with SOAP content.*
- class [PayloadStreamInterface](#)  
*Stream-like Payload for [Message](#) object.*
- class [PayloadStream](#)  
*POSIX handle as Payload.*
- class **PDP**
- class [Service](#)  
*[Service](#) - last component in a [Message](#) Chain.*
- class [SOAPFault](#)  
*Interface to SOAP Fault message.*
- class [SOAPEnvelope](#)  
*Extends [XMLNode](#) class to support structures of SOAP message.*
- class [SOAPMessage](#)  
*[Message](#) restricted to SOAP payload.*
- class [WSAEndpointReference](#)

*Interface for manipulation of WS-Addressing Endpoint Reference.*

- class [WSAHeader](#)

*Interface for manipulation WS-Addressing information in SOAP header.*

- class [PayloadWSRF](#)

*This class combines [MessagePayload](#) with [WSRF](#).*

- class [WSRP](#)

*Base class for WS-ResourceProperties structures.*

- class [WSRPFault](#)

*Base class for WS-ResourceProperties faults.*

- class **WSRPInvalidResourcePropertyQNameFault**
- class [WSRPResourcePropertyChangeFailure](#)
- class **WSRPUnableToPutResourcePropertyDocumentFault**
- class **WSRPInvalidModificationFault**
- class **WSRPUnableToModifyResourcePropertyFault**
- class **WSRPSetResourcePropertyRequestFailedFault**
- class **WSRPInsertResourcePropertiesRequestFailedFault**
- class **WSRPUpdateResourcePropertiesRequestFailedFault**
- class **WSRPDeleteResourcePropertiesRequestFailedFault**
- class **WSRPGetResourcePropertyDocumentRequest**
- class **WSRPGetResourcePropertyDocumentResponse**
- class **WSRPGetResourcePropertyRequest**
- class **WSRPGetResourcePropertyResponse**
- class **WSRPGetMultipleResourcePropertiesRequest**
- class **WSRPGetMultipleResourcePropertiesResponse**
- class **WSRPPutResourcePropertyDocumentRequest**
- class **WSRPPutResourcePropertyDocumentResponse**
- class **WSRPModifyResourceProperties**
- class **WSRPInsertResourceProperties**
- class **WSRPUpdateResourceProperties**
- class **WSRPDeleteResourceProperties**
- class **WSRPSetResourcePropertiesRequest**
- class **WSRPSetResourcePropertiesResponse**
- class **WSRPInsertResourcePropertiesRequest**
- class **WSRPInsertResourcePropertiesResponse**
- class **WSRPUpdateResourcePropertiesRequest**
- class **WSRPUpdateResourcePropertiesResponse**
- class **WSRPDeleteResourcePropertiesRequest**
- class **WSRPDeleteResourcePropertiesResponse**
- class **WSRPQueryResourcePropertiesRequest**
- class **WSRPQueryResourcePropertiesResponse**
- class [WSRF](#)

*Base class for every [WSRF](#) message.*

- class [WSRFBBaseFault](#)

*Base class for [WSRF](#) fault messages.*

- class **WSRFResourceUnknownFault**
- class **WSRFResourceUnavailableFault**

## Typedefs

- typedef enum Arc::XSDTYPETag **XSDTYPE**
- typedef char \* **xsd\_\_string**
- typedef bool **xsd\_\_boolean**
- typedef float **xsd\_\_float**
- typedef double **xsd\_\_double**
- typedef double **xsd\_\_decimal**
- typedef Period **xsd\_\_duration**
- typedef [Time](#) **xsd\_\_dateTime**
- typedef [Time](#) **xsd\_\_time**
- typedef [Time](#) **xsd\_\_date**
- typedef [Time](#) **xsd\_\_gYearMonth**
- typedef [Time](#) **xsd\_\_gYear**

## Variables

- `Logger stringLogger`
- `const Glib::TimeVal ETERNAL`
- `const Glib::TimeVal HISTORIC`
- `const char * WSRFBaseFaultAction`

### 4.1.1 Detailed Description

Deal with the serilization and deserilization about basic datatype (Build-in datatype in "XML Schema Part 2: Datatypes Second Edition": <http://www.w3.org/TR/xmlschema-2/>)

### 4.1.2 Typedef Documentation

#### 4.1.2.1 typedef [loader\\_descriptor](#) [Arc::loader\\_descriptors](#)[]

Elements are detected by presence of element with particular name of `loader_descriptors` type. That is an array of [loader\\_descriptor](#) or similar elements. To check for end of array use `ARC_LOADER_FINAL()` macro

#### 4.1.2.2 typedef `std::multimap<std::string,std::string>` [Arc::AttrMap](#)

A typedef of a multimap for storage of message attributes.

This typedef is used as a shorthand for a multimap that uses strings for keys as well as values. It is used within the `MessageAttributes` class for internal storage of message attributes, but is not visible externally.

#### 4.1.2.3 typedef `AttrMap::const_iterator` [Arc::AttrConstIter](#)

A typedef of a `const_iterator` for `AttrMap`.

This typedef is used as a shorthand for a `const_iterator` for `AttrMap`. It is used extensively within the [MessageAttributes](#) class as well as the `AttributesIterator` class, but is not visible externally.

#### 4.1.2.4 typedef AttrMap::iterator [Arc::AttrIter](#)

A typedef of an (non-const) iterator for AttrMap.

This typedef is used as a shorthand for a (non-const) iterator for AttrMap. It is used in one method within the [MessageAttributes](#) class, but is not visible externally.

### 4.1.3 Enumeration Type Documentation

#### 4.1.3.1 enum [Arc::TimeFormat](#)

An enumeration that contains the possible textual timeformats.

#### 4.1.3.2 enum [Arc::LogLevel](#)

Logging levels.

Logging levels for tagging and filtering log messages.

#### 4.1.3.3 enum [Arc::StatusKind](#)

Status kinds (types).

This enum defines a set of possible status kinds.

##### Enumerator:

***STATUS\_OK*** Default status - undefined error.

***GENERIC\_ERROR*** No error.

***PARSING\_ERROR*** Error does not fit any class.

***PROTOCOL\_RECOGNIZED\_ERROR*** Error detected while parsing request/response.

***UNKNOWN\_SERVICE\_ERROR*** [Message](#) does not fit into expected protocol.

***BUSY\_ERROR*** There is no destination configured for this message.

***SESSION\_CLOSE*** [Message](#) can't be processed now.

#### 4.1.3.4 enum [Arc::WSAFault](#)

WS-Addressing possible faults.

##### Enumerator:

***WSAFaultUnknown*** This is not a fault

***WSAFaultInvalidAddressingHeader*** This is not a WS-Addressing fault

### 4.1.4 Function Documentation

#### 4.1.4.1 std::ostream& Arc::operator<< (std::ostream &, const Time &)

Prints a Time-object to the given ostream – typically cout.

**4.1.4.2** `std::string Arc::TimeStamp (const TimeFormat & = Time::GetFormat ())`

Returns a time-stamp of the current time in some format.

**4.1.4.3** `std::string Arc::TimeStamp (Time, const TimeFormat & = Time::GetFormat ())`

Returns a time-stamp of some specified time in some format.

**4.1.4.4** `std::ostream& Arc::operator<< (std::ostream &, const Period &)`

Prints a Period-object to the given ostream – typically cout.

**4.1.4.5** `std::ostream& Arc::operator<< (std::ostream & os, LogLevel level)`

Printing of LogLevel values to ostreams.

Output operator so that LogLevel values can be printed in a nicer way.

**4.1.4.6** `template<typename T> T Arc::stringto (const std::string & s)`

This method converts a string to any type.

**4.1.4.7** `template<typename T> std::string Arc::tostring (T t, const int width = 0, const int precision = 0)`

This method converts a long to any type of the width given.

**4.1.4.8** `bool Arc::CreateThreadFunction (void(*) (void *) func, void * arg)`

Helper function to create simple thread.

It takes care of all peculiarities of Glib::Thread API. As result it runs function 'func' with argument 'arg' in a separate thread. Returns true on success.

**4.1.4.9** `bool Arc::MatchXMLName (xmlNodePtr node1, xmlNodePtr node2)`

Returns true if XML elements have same names

**4.1.4.10** `bool Arc::MatchXMLName (xmlNodePtr node, const char * name)`

Returns true if 'name' matches name of 'node'. If name contains prefix it's checked too

**4.1.4.11** `bool Arc::MatchXMLName (const XMLNode & node1, const XMLNode & node2)`

Returns true if underlying XML elements have same names

**4.1.4.12** `bool Arc::MatchXMLName (const XMLNode & node, const char * name)`

Returns true if 'name' matches name of 'node'. If name contains prefix it's checked too

**4.1.4.13** `std::string Arc::string (StatusKind kind)`

Conversion to string.

Conversion from StatusKind to string.

**Parameters:**

*kind* The StatusKind to convert.

**4.1.4.14** `const char* Arc::ContentFromPayload (const MessagePayload & payload)`

Returns pointer to main memory chunk of [Message](#) payload.

If no buffer is present or if payload is not of [PayloadRawInterface](#) type NULL is returned.

**4.1.4.15** `void Arc::WSAFaultAssign (SOAPEnvelope & message, WSAFault fid)`

Makes WS-Addressing fault.

It fills SOAP Fault message with WS-Addressing fault related information.

**4.1.4.16** [WSAFault](#) `Arc::WSAFaultExtract (SOAPEnvelope & message)`

Gets WS-addressing fault.

Analyzes SOAP Fault message and returns WS-Addressing fault it represents.

**4.1.5** **Variable Documentation****4.1.5.1** `const Glib::TimeVal Arc::ETERNAL`

A time very far in the future.

**4.1.5.2** `const Glib::TimeVal Arc::HISTORIC`

A time very far in the past.

## Chapter 5

# KnowARC Class Documentation

### 5.1 Arc::AttributeIterator Class Reference

An iterator class for accessing multiple values of an attribute.

```
#include <MessageAttributes.h>
```

#### Public Member Functions

- [AttributeIterator](#) ()
- const std::string & [operator \\*](#) () const
- const std::string \* [operator →](#) () const
- const [AttributeIterator](#) & [operator++](#) ()
- [AttributeIterator](#) [operator++](#) (int)
- bool [hasMore](#) () const

#### Protected Member Functions

- [AttributeIterator](#) ([AttrConstIter](#) begin, [AttrConstIter](#) end)

#### Protected Attributes

- [AttrConstIter](#) [current\\_](#)
- [AttrConstIter](#) [end\\_](#)

#### Friends

- class [MessageAttributes](#)

#### 5.1.1 Detailed Description

An iterator class for accessing multiple values of an attribute.

This is an iterator class that is used when accessing multiple values of an attribute. The `getAll()` method of the [MessageAttributes](#) class returns an [AttributeIterator](#) object that can be used to access the values of the attribute.

Typical usage is:

```
Arc::MessageAttributes attributes;
...
for (Arc::AttributeIterator iterator=attributes.getAll("Foo:Bar");
     iterator.hasMore(); ++iterator)
    std::cout << *iterator << std::endl;
```

## 5.1.2 Constructor & Destructor Documentation

### 5.1.2.1 Arc::AttributeIterator::AttributeIterator ()

Default constructor.

The default constructor. Does nothing since all attributes are instances of well-behaving STL classes.

### 5.1.2.2 Arc::AttributeIterator::AttributeIterator ([AttrConstIter](#) *begin*, [AttrConstIter](#) *end*) [protected]

Protected constructor used by the [MessageAttributes](#) class.

This constructor is used to create an iterator for iteration over all values of an attribute. It is not supposed to be visible externally, but is only used from within the `getAll()` method of [MessageAttributes](#) class.

#### Parameters:

*begin* A `const_iterator` pointing to the first matching key-value pair in the internal multimap of the [MessageAttributes](#) class.

*end* A `const_iterator` pointing to the first key-value pair in the internal multimap of the [MessageAttributes](#) class where the key is larger than the key searched for.

## 5.1.3 Member Function Documentation

### 5.1.3.1 bool Arc::AttributeIterator::hasMore () const

Predicate method for iteration termination.

This method determines whether there are more values for the iterator to refer to.

#### Returns:

Returns true if there are more values, otherwise false.

### 5.1.3.2 const std::string& Arc::AttributeIterator::operator \* () const

The dereference operator.

This operator is used to access the current value referred to by the iterator.

#### Returns:

A (constant reference to a) string representation of the current value.

### 5.1.3.3 [AttributeIterator](#) Arc::AttributeIterator::operator++ (int)

The postfix advance operator.

Advances the iterator to the next value. Works intuitively.

**Returns:**

An iterator referring to the value referred to by this iterator before the advance.

### 5.1.3.4 `const AttributeIterator&` Arc::AttributeIterator::operator++ ()

The prefix advance operator.

Advances the iterator to the next value. Works intuitively.

**Returns:**

A const reference to this iterator.

### 5.1.3.5 `const std::string*` Arc::AttributeIterator::operator $\rightarrow$ () `const`

The arrow operator.

Used to call methods for value objects (strings) conveniently.

## 5.1.4 Friends And Related Function Documentation

### 5.1.4.1 `friend class MessageAttributes` [friend]

The [MessageAttributes](#) class is a friend.

The constructor that creates an [AttributeIterator](#) that is connected to the internal multimap of the [MessageAttributes](#) class should not be exposed to the outside, but it still needs to be accessible from the `getAll()` method of the [MessageAttributes](#) class. Therefore, that class is a friend.

## 5.1.5 Member Data Documentation

### 5.1.5.1 `AttrConstIter` Arc::AttributeIterator::current\_ [protected]

A `const_iterator` pointing to the current key-value pair.

This iterator is the internal representation of the current value. It points to the corresponding key-value pair in the internal multimap of the [MessageAttributes](#) class.

### 5.1.5.2 `AttrConstIter` Arc::AttributeIterator::end\_ [protected]

A `const_iterator` pointing beyond the last key-value pair.

A `const_iterator` pointing to the first key-value pair in the internal multimap of the [MessageAttributes](#) class where the key is larger than the key searched for.

The documentation for this class was generated from the following file:

- MessageAttributes.h

## 5.2 Arc::ChainContext Class Reference

Interface to chain specific functionality.

```
#include <Loader.h>
```

### Public Member Functions

- [operator ServiceFactory \\* \(\)](#)
- [operator MCCFactory \\* \(\)](#)
- [operator SecHandlerFactory \\* \(\)](#)
- [operator PDPFactory \\* \(\)](#)

### Friends

- class **Loader**

### 5.2.1 Detailed Description

Interface to chain specific functionality.

Object of this class is associated with every [Loader](#) object. It is accessible for [MCC](#) and [Service](#) components and provides an interface to manipulate chains stored in [Loader](#). This makes it possible to modify chains dynamically - like deploying new services on demand.

### 5.2.2 Member Function Documentation

#### 5.2.2.1 Arc::ChainContext::operator [MCCFactory](#) \* () [inline]

Returns associated [MCCFactory](#) object

#### 5.2.2.2 Arc::ChainContext::operator [PDPFactory](#) \* () [inline]

Returns associated [PDPFactory](#) object

#### 5.2.2.3 Arc::ChainContext::operator [SecHandlerFactory](#) \* () [inline]

Returns associated [SecHandlerFactory](#) object

#### 5.2.2.4 Arc::ChainContext::operator [ServiceFactory](#) \* () [inline]

Returns associated [ServiceFactory](#) object

The documentation for this class was generated from the following file:

- [Loader.h](#)

## 5.3 Arc::Config Class Reference

Configuration element - represents (sub)tree of ARC configuration.

```
#include <ArcConfig.h>
```

Inheritance diagram for Arc::Config::

### Public Member Functions

- [Config](#) ()
- [Config](#) (const char \*filename)
- [Config](#) (const std::string &xml\_str)
- [Config](#) (Arc::XMLNode xml)
- void [print](#) (void)
- void [parse](#) (const char \*filename)

#### 5.3.1 Detailed Description

Configuration element - represents (sub)tree of ARC configuration.

This class is intended to be used to pass configuration details to various parts of HED and external modules. Currently it's just a wrapper over XML tree. But than may change in a future, although interface should be preserved. Currently it is capable of loading XML configuration document from file. In future it will be capable of loading more user-readable format and process it into tree-like structure convenient for machine processing (XML-like). So far there are no schema and/or namespaces assigned.

#### 5.3.2 Constructor & Destructor Documentation

##### 5.3.2.1 Arc::Config::Config () [inline]

Dummy constructor - produces empty structure

##### 5.3.2.2 Arc::Config::Config (const char \*filename)

Loads configuration document from file 'filename'

##### 5.3.2.3 Arc::Config::Config (const std::string &xml\_str) [inline]

Parse configuration document from memory

#### 5.3.2.4 Arc::Config::Config ([Arc::XMLNode xml](#)) [inline]

Acquire existing XML (sub)tree. Content is not copied. Make sure XML tree is not destroyed while in use by this object.

### 5.3.3 Member Function Documentation

#### 5.3.3.1 void Arc::Config::parse (const char \* *filename*)

Parse configuration document from file 'filename'

#### 5.3.3.2 void Arc::Config::print (void)

Print structure of document. For debugging purposes. Printed content is not an XML document.

The documentation for this class was generated from the following file:

- ArcConfig.h

## 5.4 Arc::Counter Class Reference

A class defining a common interface for counters.

```
#include <Counter.h>
```

Inheritance diagram for Arc::Counter::

### Public Member Functions

- virtual `~Counter ()`
- virtual int `getLimit ()=0`
- virtual int `setLimit (int newLimit)=0`
- virtual int `changeLimit (int amount)=0`
- virtual int `getExcess ()=0`
- virtual int `setExcess (int newExcess)=0`
- virtual int `changeExcess (int amount)=0`
- virtual int `getValue ()=0`
- virtual `CounterTicket reserve (int amount=1, Glib::TimeVal duration=ETERNAL, bool prioritized=false, Glib::TimeVal timeOut=ETERNAL)=0`

### Protected Types

- typedef unsigned long long int `IDType`

### Protected Member Functions

- `Counter ()`
- virtual void `cancel (IDType reservationID)=0`
- virtual void `extend (IDType &reservationID, Glib::TimeVal &expiryTime, Glib::TimeVal duration=ETERNAL)=0`
- Glib::TimeVal `getCurrentTime ()`
- Glib::TimeVal `getExpiryTime (Glib::TimeVal duration)`
- `CounterTicket getCounterTicket (Counter::IDType reservationID, Glib::TimeVal expiryTime, Counter *counter)`
- `ExpirationReminder getExpirationReminder (Glib::TimeVal expTime, Counter::IDType resID)`

### Friends

- class `CounterTicket`
- class `ExpirationReminder`

### 5.4.1 Detailed Description

A class defining a common interface for counters.

This class defines a common interface for counters as well as some common functionality.

The purpose of a counter is to provide housekeeping some resource such as e.g. disk space, memory or network bandwidth. The counter itself will not be aware of what kind of resource it limits the use of. Neither will it be aware of what unit is being used to measure that resource. Counters are thus very similar to semaphores. Furthermore, counters are designed to handle concurrent operations from multiple threads/processes in a consistent manner.

Every counter has a limit, an excess limit and a value. The limit is a number that specify how many units are available for reservation. The value is the number of units that are currently available for reservation, i.e. has not allready been reserved. The excess limit specify how many extra units can be reserved for high priority needs even if there are no normal units available for reservation. The excess limit is similar to the credit limit of e.g. a VISA card.

The users of the resource must thus first call the counter in order to make a reservation of an appropriate amount of the resource, then allocate and use the resource and finally call the counter again to cancel the reservation.

Typical usage is:

```
// Declare a counter. Replace XYZ by some appropriate kind of
// counter and provide required parameters. Unit is MB.
Arc::XYZCounter memory(...);
...
// Make a reservation of memory for 2000000 doubles.
Arc::CounterTicket tick = memory.reserve(2*sizeof(double));
// Use the memory.
double* A=new double[2000000];
doSomething(A);
delete[] A;
// Cancel the reservation.
tick.cancel();
```

There are also alternative ways to make reservations, including self-expiring reservations, prioritized reservations and reservations that fail if they cannot be made fast enough.

For self expiring reservations, a duration is provided in the reserve call:

```
tick = memory.reserve(2*sizeof(double), Glib::TimeVal(1,0));
```

A self-expiring reservation can be cancelled explicitly before it expires, but if it is not cancelled it will expire automatically when the duration has passed. The default value for the duration is [Arc::ETERNAL](#), which means that the reservation will not be cancelled automatically.

Prioritized reservations may use the excess limit and succeed immediately even if there are no normal units available for reservation. The value of the counter will in this case become negative. A prioritized reservation looks like this:

```
tick = memory.reserve(2*sizeof(double), Glib::TimeVal(1,0), true);
```

Finally, a time out option can be provided for a reservation. If some task should be performed within two seconds or not at all, the reservation can look like this:

```
tick = memory.reserve(2*sizeof(double), Glib::TimeVal(1,0),
                    true, Glib::TimeVal(2,0));
if (tick.isValid())
    doSomething(...);
```

## 5.4.2 Member Typedef Documentation

### 5.4.2.1 typedef unsigned long long int [Arc::Counter::IDType](#) [protected]

A typedef of identification numbers for reservation.

This is a type that is used as identification numbers (keys) for referencing of reservations. It is used internally in counters for book keeping of reservations as well as in the [CounterTicket](#) class in order to be able to cancel and extend reservations.

## 5.4.3 Constructor & Destructor Documentation

### 5.4.3.1 [Arc::Counter::Counter](#) () [protected]

Default constructor.

This is the default constructor. Since [Counter](#) is an abstract class, it should only be used by subclasses. Therefore it is protected. Furthermore, since the [Counter](#) class has no attributes, nothing needs to be initialized and thus this constructor is empty.

### 5.4.3.2 virtual [Arc::Counter::~~Counter](#) () [virtual]

The destructor.

This is the destructor of the [Counter](#) class. Since the [Counter](#) class has no attributes, nothing needs to be cleaned up and thus the destructor is empty.

## 5.4.4 Member Function Documentation

### 5.4.4.1 virtual void [Arc::Counter::cancel](#) ([IDType reservationID](#)) [protected, pure virtual]

Cancellation of a reservation.

This method cancels a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

#### Parameters:

*reservationID* The identity number (key) of the reservation to cancel.

### 5.4.4.2 virtual int [Arc::Counter::changeExcess](#) (int *amount*) [pure virtual]

Changes the excess limit of the counter.

Changes the excess limit of the counter by adding a certain amount to the current excess limit.

#### Parameters:

*amount* The amount by which to change the excess limit.

#### Returns:

The new excess limit.

Implemented in [Arc::IntraProcessCounter](#).

#### 5.4.4.3 virtual int Arc::Counter::changeLimit (int *amount*) [pure virtual]

Changes the limit of the counter.

Changes the limit of the counter by adding a certain amount to the current limit.

##### Parameters:

*amount* The amount by which to change the limit.

##### Returns:

The new limit.

Implemented in [Arc::IntraProcessCounter](#).

#### 5.4.4.4 virtual void Arc::Counter::extend (IDType & *reservationID*, Glib::TimeVal & *expiryTime*, Glib::TimeVal *duration* = ETERNAL) [protected, pure virtual]

Extension of a reservation.

This method extends a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

##### Parameters:

*reservationID* Used for input as well as output. Contains the identification number of the original reservation on entry and the new identification number of the extended reservation on exit.

*expiryTime* Used for input as well as output. Contains the expiry time of the original reservation on entry and the new expiry time of the extended reservation on exit.

*duration* The time by which to extend the reservation. The new expiration time is computed based on the current time, NOT the previous expiration time.

#### 5.4.4.5 CounterTicket Arc::Counter::getCounterTicket (Counter::IDType *reservationID*, Glib::TimeVal *expiryTime*, Counter \* *counter*) [protected]

A "relay method" for a constructor of the [CounterTicket](#) class.

This method acts as a relay for one of the constructors of the [CounterTicket](#) class. That constructor is private, but needs to be accessible from the subclasses of [Counter](#) (but not from anywhere else). In order not to have to declare every possible subclass of [Counter](#) as a friend of [CounterTicket](#), only the base class [Counter](#) is a friend and its subclasses access the constructor through this method. (If C++ had supported "package access", as Java does, this trick would not have been necessary.)

##### Parameters:

*reservationID* The identity number of the reservation corresponding to the [CounterTicket](#).

*expiryTime* the expiry time of the reservation corresponding to the [CounterTicket](#).

*counter* The [Counter](#) from which the reservation has been made.

##### Returns:

The counter ticket that has been created.

#### 5.4.4.6 **Glib::TimeVal Arc::Counter::getCurrentTime ()** [protected]

Get the current time.

Returns the current time. An "adapter method" for the `assign_current_time()` method in the `Glib::TimeVal` class. return The current time.

#### 5.4.4.7 **virtual int Arc::Counter::getExcess ()** [pure virtual]

Returns the excess limit of the counter.

Returns the excess limit of the counter, i.e. by how much the usual limit may be exceeded by prioritized reservations.

##### Returns:

The excess limit.

Implemented in [Arc::IntraProcessCounter](#).

#### 5.4.4.8 **ExpirationReminder Arc::Counter::getExpirationReminder (Glib::TimeVal *expTime*, Counter::IDType *resID*)** [protected]

A "relay method" for the constructor of [ExpirationReminder](#).

This method acts as a relay for one of the constructors of the [ExpirationReminder](#) class. That constructor is private, but needs to be accessible from the subclasses of [Counter](#) (but not from anywhere else). In order not to have to declare every possible subclass of [Counter](#) as a friend of [ExpirationReminder](#), only the base class [Counter](#) is a friend and its subclasses access the constructor through this method. (If C++ had supported "package access", as Java does, this trick would not have been necessary.)

##### Parameters:

*expTime* the expiry time of the reservation corresponding to the [ExpirationReminder](#).

*resID* The identity number of the reservation corresponding to the [ExpirationReminder](#).

##### Returns:

The [ExpirationReminder](#) that has been created.

#### 5.4.4.9 **Glib::TimeVal Arc::Counter::getExpiryTime (Glib::TimeVal *duration*)** [protected]

Computes an expiry time.

This method computes an expiry time by adding a duration to the current time.

##### Parameters:

*duration* The duration.

##### Returns:

The expiry time.

**5.4.4.10 virtual int Arc::Counter::getLimit ()** [pure virtual]

Returns the current limit of the counter.

This method returns the current limit of the counter, i.e. how many units can be reserved simultaneously by different threads without claiming high priority.

**Returns:**

The current limit of the counter.

Implemented in [Arc::IntraProcessCounter](#).

**5.4.4.11 virtual int Arc::Counter::getValue ()** [pure virtual]

Returns the current value of the counter.

Returns the current value of the counter, i.e. the number of unreserved units. Initially, the value is equal to the limit of the counter. When a reservation is made, the value is decreased. Normally, the value should never be negative, but this may happen if there are prioritized reservations. It can also happen if the limit is decreased after some reservations have been made, since reservations are never revoked.

**Returns:**

The current value of the counter.

Implemented in [Arc::IntraProcessCounter](#).

**5.4.4.12 virtual CounterTicket Arc::Counter::reserve (int amount = 1, Glib::TimeVal duration = ETERNAL, bool prioritized = false, Glib::TimeVal timeOut = ETERNAL)** [pure virtual]

Makes a reservation from the counter.

This method makes a reservation from the counter. If the current value of the counter is too low to allow for the reservation, the method blocks until the reservation is possible or times out.

**Parameters:**

*amount* The amount to reserve, default value is 1.

*duration* The duration of a self expiring reservation, default is that it lasts forever.

*prioritized* Whether this reservation is prioritized and thus allowed to use the excess limit.

*timeOut* The maximum time to block if the value of the counter is too low, default is to allow "eternal" blocking.

**Returns:**

A [CounterTicket](#) that can be queried about the status of the reservation as well as for cancellations and extensions.

Implemented in [Arc::IntraProcessCounter](#).

**5.4.4.13 virtual int Arc::Counter::setExcess (int newExcess)** [pure virtual]

Sets the excess limit of the counter.

This method sets a new excess limit for the counter.

**Parameters:**

*newExcess* The new excess limit, an absolute number.

**Returns:**

The new excess limit.

Implemented in [Arc::IntraProcessCounter](#).

**5.4.4.14 virtual int Arc::Counter::setLimit (int newLimit) [pure virtual]**

Sets the limit of the counter.

This method sets a new limit for the counter.

**Parameters:**

*newLimit* The new limit, an absolute number.

**Returns:**

The new limit.

Implemented in [Arc::IntraProcessCounter](#).

**5.4.5 Friends And Related Function Documentation****5.4.5.1 friend class [CounterTicket](#) [friend]**

The [CounterTicket](#) class needs to be a friend.

**5.4.5.2 friend class [ExpirationReminder](#) [friend]**

The [ExpirationReminder](#) class needs to be a friend.

The documentation for this class was generated from the following file:

- Counter.h

## 5.5 Arc::CounterTicket Class Reference

A class for "tickets" that correspond to counter reservations.

```
#include <Counter.h>
```

### Public Member Functions

- [CounterTicket](#) ()
- bool [isValid](#) ()
- void [extend](#) (Glib::TimeVal duration)
- void [cancel](#) ()

### Friends

- class [Counter](#)

#### 5.5.1 Detailed Description

A class for "tickets" that correspond to counter reservations.

This is a class for reservation tickets. When a reservation is made from a [Counter](#), a [ReservationTicket](#) is returned. This ticket can then be queried about the validity of a reservation. It can also be used for cancelation and extension of reservations.

Typical usage is:

```
// Declare a counter. Replace XYZ by some appropriate kind of
// counter and provide required parameters. Unit is MB.
Arc::XYZCounter memory(...);
...
// Make a reservation of memory for 2000000 doubles.
Arc::CounterTicket tick = memory.reserve(2*sizeof(double));
// Use the memory.
double* A=new double[2000000];
doSomething(A);
delete[] A;
// Cancel the reservation.
tick.cancel();
```

#### 5.5.2 Constructor & Destructor Documentation

##### 5.5.2.1 Arc::CounterTicket::CounterTicket ()

The default constructor.

This is the default constructor. It creates a [CounterTicket](#) that is not valid. The ticket object that is created can later be assigned a ticket that is returned by the [reserve\(\)](#) method of a [Counter](#).

#### 5.5.3 Member Function Documentation

##### 5.5.3.1 void Arc::CounterTicket::cancel ()

Cancels a reservation.

This method is called to cancel a reservation. It may be called also for self-expiring reservations, which will then be cancelled before they were originally planned to expire.

#### 5.5.3.2 void Arc::CounterTicket::extend (Glib::TimeVal *duration*)

Extends a reservation.

Extends a self-expiring reservation. In order to succeed the extension should be made before the previous reservation expires.

##### Parameters:

*duration* The time by which to extend the reservation. The new expiration time is computed based on the current time, NOT the previous expiration time.

#### 5.5.3.3 bool Arc::CounterTicket::isValid ()

Returns the validity of a [CounterTicket](#).

This method checks whether a [CounterTicket](#) is valid. The ticket was probably returned earlier by the `reserve()` method of a [Counter](#) but the corresponding reservation may have expired.

##### Returns:

The validity of the ticket.

### 5.5.4 Friends And Related Function Documentation

#### 5.5.4.1 friend class [Counter](#) [friend]

The [Counter](#) class needs to be a friend.

The documentation for this class was generated from the following file:

- Counter.h

## 5.6 Arc::ExpirationReminder Class Reference

A class intended for internal use within counters.

```
#include <Counter.h>
```

### Public Member Functions

- bool [operator<](#) (const [ExpirationReminder](#) &other) const
- Glib::TimeVal [getExpiryTime](#) () const
- Counter::IDType [getReservationID](#) () const

### Friends

- class [Counter](#)

### 5.6.1 Detailed Description

A class intended for internal use within counters.

This class is used for "reminder objects" that are used for automatic deallocation of self-expiring reservations.

### 5.6.2 Member Function Documentation

#### 5.6.2.1 Glib::TimeVal Arc::ExpirationReminder::getExpiryTime () const

Returns the expiry time.

This method returns the expiry time of the reservation that this [ExpirationReminder](#) is associated with.

#### Returns:

The expiry time.

#### 5.6.2.2 Counter::IDType Arc::ExpirationReminder::getReservationID () const

Returns the identification number of the reservation.

This method returns the identification number of the self-expiring reservation that this [ExpirationReminder](#) is associated with.

#### Returns:

The identification number.

#### 5.6.2.3 bool Arc::ExpirationReminder::operator< (const [ExpirationReminder](#) & other) const

Less than operator, compares "soonness".

This is the less than operator for the [ExpirationReminder](#) class. It compares the priority of such objects with respect to which reservation expires first. It is used when reminder objects are inserted in a priority queue in order to always place the next reservation to expire at the top.

### 5.6.3 Friends And Related Function Documentation

#### 5.6.3.1 friend class [Counter](#) [friend]

The [Counter](#) class needs to be a friend.

The documentation for this class was generated from the following file:

- Counter.h

## 5.7 Arc::InformationContainer Class Reference

Information System document container and processor.

```
#include <InformationInterface.h>
```

Inheritance diagram for Arc::InformationContainer::

### Public Member Functions

- **InformationContainer** ([XMLNode](#) doc, bool copy=false)
- [XMLNode Acquire](#) (void)
- void **Release** (void)

### Protected Member Functions

- virtual std::list< [XMLNode](#) > **Get** (const std::list< std::string > &path)
- virtual std::list< [XMLNode](#) > **Get** ([XMLNode](#) xpath)

### Protected Attributes

- [XMLNode doc\\_](#)

#### 5.7.1 Detailed Description

Information System document container and processor.

This class inherits from [InformationInterface](#) and offers container for storing informational XML document.

#### 5.7.2 Member Function Documentation

##### 5.7.2.1 [XMLNode](#) Arc::InformationContainer::Acquire (void)

Get a lock on contained XML document. To be used in multi-threaded environment. Do not forget to release it with Release()

##### 5.7.2.2 virtual std::list<[XMLNode](#)> Arc::InformationContainer::Get (const std::list< std::string > &path) [protected, virtual]

This method is called by this object's Process method. Real implementation of this class should return (sub)tree of XML document. This method may be called multiple times per single Process call.

Reimplemented from [Arc::InformationInterface](#).

### 5.7.3 Member Data Documentation

#### 5.7.3.1 [XMLNode Arc::InformationContainer::doc\\_](#) [protected]

Either link or container of XML document

The documentation for this class was generated from the following file:

- InformationInterface.h

## 5.8 Arc::InformationInterface Class Reference

Information System message processor.

```
#include <InformationInterface.h>
```

Inheritance diagram for Arc::InformationInterface::

### Public Member Functions

- [InformationInterface](#) (bool safe=true)
- [SOAPEnvelope](#) \* **Process** ([SOAPEnvelope](#) &in)

### Protected Member Functions

- virtual std::list< [XMLNode](#) > **Get** (const std::list< std::string > &path)
- virtual std::list< [XMLNode](#) > **Get** ([XMLNode](#) xpath)

### Protected Attributes

- Glib::Mutex [lock\\_](#)
- bool [to\\_lock\\_](#)

### 5.8.1 Detailed Description

Information System message processor.

This class provides callback for 2 operations of WS-ResourceProperties and convenient parsing/generation of corresponding SOAP messages. In a future it may extend range of supported specifications.

### 5.8.2 Constructor & Destructor Documentation

#### 5.8.2.1 Arc::InformationInterface::InformationInterface (bool *safe* = true)

Constructor. If 'safe' is true all calls to Get will be locked.

### 5.8.3 Member Function Documentation

#### 5.8.3.1 virtual std::list<[XMLNode](#)> Arc::InformationInterface::Get (const std::list< std::string > &*path*) [protected, virtual]

This method is called by this object's Process method. Real implementation of this class should return (sub)tree of XML document. This method may be called multiple times per single Process call.

Reimplemented in [Arc::InformationContainer](#).

## 5.8.4 Member Data Documentation

### 5.8.4.1 Glib::Mutex [Arc::InformationInterface::lock\\_](#) [protected]

Mutex used to protect access to Get methods in multi-threaded env.

The documentation for this class was generated from the following file:

- InformationInterface.h

## 5.9 Arc::InformationRequest Class Reference

Request for information in InfoSystem.

```
#include <InformationInterface.h>
```

### Public Member Functions

- [InformationRequest](#) (void)
- [InformationRequest](#) (const std::list< std::string > &path)
- [InformationRequest](#) (const std::list< std::list< std::string > > &paths)
- [InformationRequest](#) ([XMLNode](#) query)
- **operator bool** (void)
- **bool operator!** (void)
- [SOAPEnvelope](#) \* [SOAP](#) (void)

### 5.9.1 Detailed Description

Request for information in InfoSystem.

This is a convenience wrapper creating proper WS-ResourceProperties request targeted InfoSystem interface of service.

### 5.9.2 Constructor & Destructor Documentation

#### 5.9.2.1 Arc::InformationRequest::InformationRequest (void)

Dummy constructor

#### 5.9.2.2 Arc::InformationRequest::InformationRequest (const std::list< std::string > & path)

Request for attribute specified by elements of path. Currently only first element is used.

#### 5.9.2.3 Arc::InformationRequest::InformationRequest (const std::list< std::list< std::string > > & paths)

Request for attribute specified by elements of paths. Currently only first element of every path is used.

#### 5.9.2.4 Arc::InformationRequest::InformationRequest ([XMLNode](#) query)

Request for attributes specified by XPath query.

### 5.9.3 Member Function Documentation

#### 5.9.3.1 [SOAPEnvelope](#)\* Arc::InformationRequest::SOAP (void)

Returns generated SOAP message

The documentation for this class was generated from the following file:

- [InformationInterface.h](#)

## 5.10 Arc::InformationResponse Class Reference

Informational response from InfoSystem.

```
#include <InformationInterface.h>
```

### Public Member Functions

- [InformationResponse](#) ([SOAPEnvelope](#) &soap)
- **operator bool** (void)
- **bool operator!** (void)
- `std::list< XMLNode > Result` (void)

### 5.10.1 Detailed Description

Informational response from InfoSystem.

This is a convenience wrapper analyzing WS-ResourceProperties response from InfoSystem interface of service.

### 5.10.2 Constructor & Destructor Documentation

#### 5.10.2.1 Arc::InformationResponse::InformationResponse ([SOAPEnvelope](#) & *soap*)

Constructor parses WS-ResourceProperties response. Provided [SOAPEnvelope](#) object must be valid as long as this object is in use.

### 5.10.3 Member Function Documentation

#### 5.10.3.1 `std::list<XMLNode> Arc::InformationResponse::Result` (void)

Returns set of attributes which were in SOAP message passed to constructor.

The documentation for this class was generated from the following file:

- InformationInterface.h

## 5.11 Arc::IntraProcessCounter Class Reference

A class for counters used by threads within a single process.

```
#include <IntraProcessCounter.h>
```

Inheritance diagram for Arc::IntraProcessCounter::

### Public Member Functions

- [IntraProcessCounter](#) (int limit, int excess)
- virtual [~IntraProcessCounter](#) ()
- virtual int [getLimit](#) ()
- virtual int [setLimit](#) (int newLimit)
- virtual int [changeLimit](#) (int amount)
- virtual int [getExcess](#) ()
- virtual int [setExcess](#) (int newExcess)
- virtual int [changeExcess](#) (int amount)
- virtual int [getValue](#) ()
- virtual [CounterTicket reserve](#) (int amount=1, Glib::TimeVal duration=[ETERNAL](#), bool prioritized=false, Glib::TimeVal timeOut=[ETERNAL](#))

### Protected Member Functions

- virtual void [cancel](#) (IDType reservationID)
- virtual void [extend](#) (IDType &reservationID, Glib::TimeVal &expiryTime, Glib::TimeVal duration=[ETERNAL](#))

#### 5.11.1 Detailed Description

A class for counters used by threads within a single process.

This is a class for shared among different threads within a single process. See the [Counter](#) class for further information about counters and examples of usage.

#### 5.11.2 Constructor & Destructor Documentation

##### 5.11.2.1 Arc::IntraProcessCounter::IntraProcessCounter (int *limit*, int *excess*)

Creates an [IntraProcessCounter](#) with specified limit and excess.

This constructor creates a counter with the specified limit (amount of resources available for reservation) and excess limit (an extra amount of resources that may be used for prioritized reservations).

**Parameters:**

*limit* The limit of the counter.

*excess* The excess limit of the counter.

**5.11.2.2 virtual Arc::IntraProcessCounter::~~IntraProcessCounter () [virtual]**

Destructor.

This is the destructor of the [IntraProcessCounter](#) class. Does not need to do anything.

**5.11.3 Member Function Documentation****5.11.3.1 virtual void Arc::IntraProcessCounter::cancel (IDType reservationID) [protected, virtual]**

Cancellation of a reservation.

This method cancels a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

**Parameters:**

*reservationID* The identity number (key) of the reservation to cancel.

**5.11.3.2 virtual int Arc::IntraProcessCounter::changeExcess (int amount) [virtual]**

Changes the excess limit of the counter.

Changes the excess limit of the counter by adding a certain amount to the current excess limit.

**Parameters:**

*amount* The amount by which to change the excess limit.

**Returns:**

The new excess limit.

Implements [Arc::Counter](#).

**5.11.3.3 virtual int Arc::IntraProcessCounter::changeLimit (int amount) [virtual]**

Changes the limit of the counter.

Changes the limit of the counter by adding a certain amount to the current limit.

**Parameters:**

*amount* The amount by which to change the limit.

**Returns:**

The new limit.

Implements [Arc::Counter](#).

#### 5.11.3.4 **virtual void Arc::IntraProcessCounter::extend (IDType & reservationID, Glib::TimeVal & expiryTime, Glib::TimeVal duration = ETERNAL)** [protected, virtual]

Extension of a reservation.

This method extends a reservation. It is called by the [CounterTicket](#) that corresponds to the reservation.

##### Parameters:

**reservationID** Used for input as well as output. Contains the identification number of the original reservation on entry and the new identification number of the extended reservation on exit.

**expiryTime** Used for input as well as output. Contains the expiry time of the original reservation on entry and the new expiry time of the extended reservation on exit.

**duration** The time by which to extend the reservation. The new expiration time is computed based on the current time, NOT the previous expiration time.

#### 5.11.3.5 **virtual int Arc::IntraProcessCounter::getExcess ()** [virtual]

Returns the excess limit of the counter.

Returns the excess limit of the counter, i.e. by how much the usual limit may be exceeded by prioritized reservations.

##### Returns:

The excess limit.

Implements [Arc::Counter](#).

#### 5.11.3.6 **virtual int Arc::IntraProcessCounter::getLimit ()** [virtual]

Returns the current limit of the counter.

This method returns the current limit of the counter, i.e. how many units can be reserved simultaneously by different threads without claiming high priority.

##### Returns:

The current limit of the counter.

Implements [Arc::Counter](#).

#### 5.11.3.7 **virtual int Arc::IntraProcessCounter::getValue ()** [virtual]

Returns the current value of the counter.

Returns the current value of the counter, i.e. the number of unreserved units. Initially, the value is equal to the limit of the counter. When a reservation is made, the value is decreased. Normally, the value should never be negative, but this may happen if there are prioritized reservations. It can also happen if the limit is decreased after some reservations have been made, since reservations are never revoked.

##### Returns:

The current value of the counter.

Implements [Arc::Counter](#).

**5.11.3.8** `virtual CounterTicket Arc::IntraProcessCounter::reserve (int amount = 1, Glib::TimeVal duration = ETERNAL, bool prioritized = false, Glib::TimeVal timeOut = ETERNAL) [virtual]`

Makes a reservation from the counter.

This method makes a reservation from the counter. If the current value of the counter is too low to allow for the reservation, the method blocks until the reservation is possible or times out.

**Parameters:**

*amount* The amount to reserve, default value is 1.

*duration* The duration of a self expiring reservation, default is that it lasts forever.

*prioritized* Whether this reservation is prioritized and thus allowed to use the excess limit.

*timeOut* The maximum time to block if the value of the counter is too low, default is to allow "eternal" blocking.

**Returns:**

A [CounterTicket](#) that can be queried about the status of the reservation as well as for cancellations and extensions.

Implements [Arc::Counter](#).

**5.11.3.9** `virtual int Arc::IntraProcessCounter::setExcess (int newExcess) [virtual]`

Sets the excess limit of the counter.

This method sets a new excess limit for the counter.

**Parameters:**

*newExcess* The new excess limit, an absolute number.

**Returns:**

The new excess limit.

Implements [Arc::Counter](#).

**5.11.3.10** `virtual int Arc::IntraProcessCounter::setLimit (int newLimit) [virtual]`

Sets the limit of the counter.

This method sets a new limit for the counter.

**Parameters:**

*newLimit* The new limit, an absolute number.

**Returns:**

The new limit.

Implements [Arc::Counter](#).

The documentation for this class was generated from the following file:

- IntraProcessCounter.h

## 5.12 Arc::Loader Class Reference

Creator of [Message](#) Component Chains ([MCC](#)).

```
#include <Loader.h>
```

### Public Types

- typedef std::map< std::string, [MCC](#) \* > **mcc\_container\_t**
- typedef std::map< std::string, [Service](#) \* > **service\_container\_t**
- typedef std::map< std::string, SecHandler \* > **sechandler\_container\_t**
- typedef std::map< std::string, DMC \* > **dmc\_container\_t**
- typedef std::map< std::string, [Plexer](#) \* > **plexer\_container\_t**

### Public Member Functions

- [Loader](#) ([Config](#) \*cfg)
- [~Loader](#) ()
- [MCC](#) \* [operator\[\]](#) (const std::string &id)

### Static Public Attributes

- static [Logger](#) **logger**

### Friends

- class **ChainContext**

#### 5.12.1 Detailed Description

Creator of [Message](#) Component Chains ([MCC](#)).

This class processes XML configuration and creates message chains. Accepted configuration is defined by XML schema mcc.xsd. Supported components are of types [MCC](#), [Service](#) and [Plexer](#). [MCC](#) and [Service](#) are loaded from dynamic libraries. For [Plexer](#) only internal implementation is supported. This object is also a container for loaded componets. All components and chains are destroyed if this object is destroyed. Chains are created in 2 steps. First all components are loaded and corresponding objects are created. Constructors are supplied with corresponding configuration subtrees. During next step components are linked together by calling their Next() methods. Each call creates labeled link to next component in a chain. 2 step method has an advantage over single step because it allows loops in chains and makes loading procedure more simple. But that also means during short period of time components are only partly configured. Components in such state must produce proper error response if [Message](#) arrives. Note: Current implementation requires all components and links to be labeled. All labels must be unique. Future implementation will be able to assign labels automatically.

#### 5.12.2 Constructor & Destructor Documentation

##### 5.12.2.1 Arc::Loader::Loader ([Config](#) \* cfg)

Constructor that takes whole XML configuration and creates component chains

### 5.12.2.2 Arc::Loader::~~Loader ()

Destructor destroys all components created by constructor

## 5.12.3 Member Function Documentation

### 5.12.3.1 ]

[MCC](#)\* Arc::Loader::operator[] (const std::string & *id*)

Access entry MCCs in chains. Those are compnents exposed for external access using 'entry' attribute

The documentation for this class was generated from the following file:

- Loader.h

## 5.13 Arc::loader\_descriptor Struct Reference

Identifier of plugin.

```
#include <LoaderFactory.h>
```

### Public Attributes

- const char \* **name**
- int **version**
- void \*(\* **get\_instance** )(Arc::Config \*cfg, Arc::ChainContext \*ctx)

### 5.13.1 Detailed Description

Identifier of plugin.

This structure describes set of elements stored in shared library. It contains name of plugin, version number and pointer to function which creates an instance of object.

The documentation for this struct was generated from the following file:

- LoaderFactory.h

## 5.14 Arc::LoaderFactory Class Reference

Plugin handler.

```
#include <LoaderFactory.h>
```

Inheritance diagram for Arc::LoaderFactory::

### Public Member Functions

- void [load\\_all\\_instances](#) (const std::string &libname)

### Protected Member Functions

- [LoaderFactory](#) ([Config](#) \*cfg, const std::string &id)
- void \* [get\\_instance](#) (const std::string &name, [Arc::Config](#) \*cfg, [Arc::ChainContext](#) \*ctx)
- void \* [get\\_instance](#) (const std::string &name, int version, [Arc::Config](#) \*cfg, [Arc::ChainContext](#) \*ctx)
- void \* [get\\_instance](#) (const std::string &name, int min\_version, int max\_version, [Arc::Config](#) \*cfg, [Arc::ChainContext](#) \*ctx)

### 5.14.1 Detailed Description

Plugin handler.

This class handles shared libraries containing loadable classes

### 5.14.2 Constructor & Destructor Documentation

#### 5.14.2.1 Arc::LoaderFactory::LoaderFactory ([Config](#) \*cfg, const std::string &id) [protected]

Constructor - accepts configuration (not yet used) meant to tune loading of modules.

### 5.14.3 Member Function Documentation

#### 5.14.3.1 void\* Arc::LoaderFactory::get\_instance (const std::string &name, [Arc::Config](#) \*cfg, [Arc::ChainContext](#) \*ctx) [protected]

These methods load shared library named lib`name`, locates symbol named `id\_` representing descriptor of elements and calls it's constructor function. Supplied configuration tree and context are passed to constructor. Returns created instance. This classes must not be used directly. Inheriting classes must implement it with proper type casting.

Reimplemented in [Arc::MCCFactory](#), [Arc::PDPFactory](#), [Arc::SecHandlerFactory](#), and [Arc::ServiceFactory](#).

#### 5.14.3.2 void Arc::LoaderFactory::load\_all\_instances (const std::string & *libname*)

Loads shared library named 'libname' and identifies all elements it provides. Subsequent calls to [get\\_instance\(\)](#) methods will be able to locate needed elements even if they are not stored in library named after element name.

The documentation for this class was generated from the following file:

- LoaderFactory.h

## 5.15 Arc::LogDestination Class Reference

A base class for log destinations.

```
#include <Logger.h>
```

Inheritance diagram for Arc::LogDestination::

### Public Member Functions

- virtual void [log](#) (const [LogMessage](#) &message)=0

### Protected Member Functions

- [LogDestination](#) ()

#### 5.15.1 Detailed Description

A base class for log destinations.

This class defines an interface for LogDestinations. [LogDestination](#) objects will typically contain synchronization mechanisms and should therefore never be copied.

#### 5.15.2 Constructor & Destructor Documentation

##### 5.15.2.1 Arc::LogDestination::LogDestination () [protected]

Default constructor.

The only constructor needed by subclasses, since the [LogDestination](#) class has no attributes.

#### 5.15.3 Member Function Documentation

##### 5.15.3.1 virtual void Arc::LogDestination::log (const [LogMessage](#) & message) [pure virtual]

Logs a [LogMessage](#) to this [LogDestination](#).

Implemented in [Arc::LogStream](#).

The documentation for this class was generated from the following file:

- [Logger.h](#)

## 5.16 Arc::Logger Class Reference

A logger class.

```
#include <Logger.h>
```

### Public Member Functions

- [Logger](#) ([Logger](#) &parent, const std::string &subdomain)
- [Logger](#) ([Logger](#) &parent, const std::string &subdomain, [LogLevel](#) threshold)
- void [addDestination](#) ([LogDestination](#) &destination)
- void [setThreshold](#) ([LogLevel](#) threshold)
- [LogLevel](#) [getThreshold](#) () const
- void [msg](#) ([LogMessage](#) message)
- void [msg](#) ([LogLevel](#) level, const std::string &str,...)

### Static Public Attributes

- static [Logger](#) [rootLogger](#)

#### 5.16.1 Detailed Description

A logger class.

This class defines a [Logger](#) to which LogMessages can be sent.

Every [Logger](#) (except for the rootLogger) has a parent [Logger](#). The domain of a [Logger](#) (a string that indicates the origin of LogMessages) is composed by adding a subdomain to the domain of its parent [Logger](#).

A [Logger](#) also has a threshold. Every [LogMessage](#) that have a level that is greater than or equal to the threshold is forwarded to any [LogDestination](#) connected to this [Logger](#) as well as to the parent [Logger](#).

Typical usage of the [Logger](#) class is to declare a global [Logger](#) object for each library/module/component to be used by all classes and methods there.

#### 5.16.2 Constructor & Destructor Documentation

##### 5.16.2.1 Arc::Logger::Logger ([Logger](#) &parent, const std::string &subdomain)

Creates a logger.

Creates a logger. The threshold is inherited from its parent [Logger](#).

##### Parameters:

*parent* The parent [Logger](#) of the new [Logger](#).

*subdomain* The subdomain of the new logger.

### 5.16.2.2 Arc::Logger::Logger ([Logger](#) & *parent*, const std::string & *subdomain*, [LogLevel](#) *threshold*)

Creates a logger.

Creates a logger.

#### Parameters:

*parent* The parent [Logger](#) of the new [Logger](#).

*subdomain* The subdomain of the new logger.

*threshold* The threshold of the new logger.

## 5.16.3 Member Function Documentation

### 5.16.3.1 void Arc::Logger::addDestination ([LogDestination](#) & *destination*)

Adds a [LogDestination](#).

Adds a [LogDestination](#) to which to forward LogMessages sent to this logger (if they pass the threshold). Since LogDestinatoin should not be copied, the new [LogDestination](#) is passed by reference and a pointer to it is kept for later use. It is therefore important that the [LogDestination](#) passed to this [Logger](#) exists at least as long as the [Logger](#) itself.

### 5.16.3.2 [LogLevel](#) Arc::Logger::getThreshold () const

Returns the threshold.

Returns the threshold.

#### Returns:

The threshold of this [Logger](#).

### 5.16.3.3 void Arc::Logger::msg ([LogLevel](#) *level*, const std::string & *str*, ...)

Logs a message text.

Logs a message text string at the specified LogLevel. This is a convenience method to save some typing. It simply creates a [LogMessage](#) and sends it to the other [msg\(\)](#) method.

#### Parameters:

*level* The level of the message.

*str* The message text.

### 5.16.3.4 void Arc::Logger::msg ([LogMessage](#) *message*)

Sends a [LogMessage](#).

Sends a [LogMessage](#).

#### Parameters:

*The* [LogMessage](#) to send.

#### 5.16.3.5 void Arc::Logger::setThreshold ([LogLevel](#) *threshold*)

Sets the threshold.

This method sets the threshold of the [Logger](#). Any message sent to this [Logger](#) that has a level below this threshold will be discarded.

##### Parameters:

*The* threshold

### 5.16.4 Member Data Documentation

#### 5.16.4.1 [Logger Arc::Logger::rootLogger](#) [static]

The root [Logger](#).

This is the root [Logger](#). It is an ancestor of any other [Logger](#) and always exists.

The documentation for this class was generated from the following file:

- [Logger.h](#)

## 5.17 Arc::LogMessage Class Reference

A class for log messages.

```
#include <Logger.h>
```

### Public Member Functions

- [LogMessage](#) ([LogLevel](#) level, const std::string &message, va\_list v=NULL)
- [LogMessage](#) ([LogLevel](#) level, const std::string &message, const std::string &identifier, va\_list v=NULL)
- [LogLevel](#) [getLevel](#) () const

### Protected Member Functions

- void [setIdentifier](#) (std::string identifier)

### Friends

- class [Logger](#)
- std::ostream & [operator<<](#) (std::ostream &os, const [LogMessage](#) &message)

#### 5.17.1 Detailed Description

A class for log messages.

This class is used to represent log messages internally. It contains the time the message was created, its level, from which domain it was sent, an identifier and the message text itself.

#### 5.17.2 Constructor & Destructor Documentation

##### 5.17.2.1 Arc::LogMessage::LogMessage ([LogLevel](#) level, const std::string & message, va\_list v = NULL)

Creates a [LogMessage](#) with the specified level and message text.

This constructor creates a [LogMessage](#) with the specified level and message text. The time is set automatically, the domain is set by the [Logger](#) to which the [LogMessage](#) is sent and the identifier is composed from the process ID and the address of the Thread object corresponding to the calling thread.

##### Parameters:

- level* The level of the [LogMessage](#).
- message* The message text.

##### 5.17.2.2 Arc::LogMessage::LogMessage ([LogLevel](#) level, const std::string & message, const std::string & identifier, va\_list v = NULL)

Creates a [LogMessage](#) with the specified attributes.

This constructor creates a [LogMessage](#) with the specified level, message text and identifier. The time is set automatically and the domain is set by the [Logger](#) to which the [LogMessage](#) is sent.

**Parameters:**

- level* The level of the [LogMessage](#).
- message* The message text.
- ident* The identifier of the [LogMessage](#).

### 5.17.3 Member Function Documentation

#### 5.17.3.1 [LogLevel](#) [Arc::LogMessage::getLevel \(\) const](#)

Returns the level of the [LogMessage](#).

Returns the level of the [LogMessage](#).

**Returns:**

The level of the [LogMessage](#).

#### 5.17.3.2 `void Arc::LogMessage::setIdentifier (std::string identifier)` [protected]

Sets the identifier of the [LogMessage](#).

The purpose of this method is to allow subclasses (in case there are any) to set the identifier of a [LogMessage](#).

**Parameters:**

*The* identifier.

### 5.17.4 Friends And Related Function Documentation

#### 5.17.4.1 `friend class Logger` [friend]

The [Logger](#) class is a friend.

The [Logger](#) class must have some privileges (e.g. ability to call the `setDomain()` method), therefore it is a friend.

#### 5.17.4.2 `std::ostream& operator<< (std::ostream & os, const LogMessage & message)` [friend]

Printing of LogMessages to ostreams.

Output operator so that LogMessages can be printed conveniently by LogDestinations.

The documentation for this class was generated from the following file:

- [Logger.h](#)

## 5.18 Arc::LogStream Class Reference

A class for logging to ostreams.

```
#include <Logger.h>
```

Inheritance diagram for Arc::LogStream::

### Public Member Functions

- [LogStream](#) (std::ostream &destination)
- virtual void [log](#) (const [LogMessage](#) &message)

### 5.18.1 Detailed Description

A class for logging to ostreams.

This class is used for logging to ostreams (cout, cerr, files). It provides synchronization in order to prevent different LogMessages to appear mixed with each other in the stream. In order not to break the synchronization, LogStreams should never be copied. Therefore the copy constructor and assignment operator are private. Furthermore, it is important to keep a [LogStream](#) object as long as the [Logger](#) to which it has been registered.

### 5.18.2 Constructor & Destructor Documentation

#### 5.18.2.1 Arc::LogStream::LogStream (std::ostream & destination)

Creates a [LogStream](#) connected to an ostream.

Creates a [LogStream](#) connected to the specified ostream. In order not to break synchronization, it is important not to connect more than one [LogStream](#) object to a certain stream.

#### Parameters:

*destination* The ostream to which to write LogMessages.

### 5.18.3 Member Function Documentation

#### 5.18.3.1 virtual void Arc::LogStream::log (const [LogMessage](#) & message) [virtual]

Writes a [LogMessage](#) to the stream.

This method writes a [LogMessage](#) to the ostream that is connected to this [LogStream](#) object. It is synchronized so that not more than one [LogMessage](#) can be written at a time.

#### Parameters:

*message* The [LogMessage](#) to write.

Implements [Arc::LogDestination](#).

The documentation for this class was generated from the following file:

- `Logger.h`

## 5.19 Arc::MCC Class Reference

**Message** Chain Component - base class for every **MCC** plugin.

```
#include <MCC.h>
```

Inheritance diagram for Arc::MCC::

### Public Member Functions

- **MCC** (Arc::Config \*cfg \_\_attribute\_\_((unused)))
- virtual void **Next** (Arc::MCCInterface \*next, const std::string &label="")
- virtual void **AddSecHandler** (Arc::Config \*cfg, Arc::SecHandler \*sechandler, const std::string &label="")
- virtual void **Unlink** (void)
- virtual Arc::MCC\_Status **process** (Arc::Message &request \_\_attribute\_\_((unused)), Arc::Message &response \_\_attribute\_\_((unused)))

### Protected Member Functions

- Arc::MCCInterface \* **Next** (const std::string &label="")

### Protected Attributes

- std::map< std::string, Arc::MCCInterface \* > **next\_**
- std::map< std::string, std::list< Arc::SecHandler \* > > **sechandlers\_**

### Static Protected Attributes

- static Arc::Logger **logger**

#### 5.19.1 Detailed Description

**Message** Chain Component - base class for every **MCC** plugin.

This is partially virtual class which defines interface and common functionality for every **MCC** plugin needed for managing of component in a chain.

## 5.19.2 Constructor & Destructor Documentation

**5.19.2.1** `Arc::MCC::MCC (Arc::Config *cfg __attribute__((unused)))` [inline]

Example constructor - [MCC](#) takes at least it's configuration subtree

## 5.19.3 Member Function Documentation

**5.19.3.1** `virtual void Arc::MCC::AddSecHandler (Arc::Config *cfg, Arc::SecHandler *sechandler, const std::string &label = "")` [virtual]

SecHandler

**5.19.3.2** `virtual void Arc::MCC::Next (Arc::MCCInterface *next, const std::string &label = "")` [virtual]

Add reference to next [MCC](#) in chain. This method is called by [Loader](#) for every potentially labeled link to next component which implements [MCCInterface](#). If next is set NULL corresponding link is removed.

Reimplemented in [Arc::Plexer](#).

**5.19.3.3** `virtual Arc::MCC_Status Arc::MCC::process (Arc::Message &request __attribute__((unused)), Arc::Message &response __attribute__((unused)))` [inline, virtual]

Dummy [Message](#) processing method. Just a placeholder.

**5.19.3.4** `virtual void Arc::MCC::Unlink (void)` [virtual]

Removing all links. Useful for destroying chains.

## 5.19.4 Member Data Documentation

**5.19.4.1** `Arc::Logger Arc::MCC::logger` [static, protected]

A logger for MCCs.

A logger intended to be the parent of loggers in the different MCCs.

Reimplemented in [Arc::Plexer](#).

**5.19.4.2** `std::map<std::string, Arc::MCCInterface*> Arc::MCC::next_` [protected]

Set of labeled "next" components. Each implemented [MCC](#) must call [process\(\)](#) method of corresponding [MCCInterface](#) from this set in own [process\(\)](#) method.

#### 5.19.4.3 `std::map<std::string,std::list<Arc::SecHandler*> >` [Arc::MCC::sechandlers\\_](#) [protected]

Set of labeled authentication and authorization handlers. [MCC](#) calls sequence of handlers at specific point depending on associated identifier. in most cases those are "in" and "out" for incoming and outgoing messages correspondingly.

The documentation for this class was generated from the following file:

- MCC.h

## 5.20 mcc\_descriptor Struct Reference

Identifier of Message Chain Componet (MCC) plugin.

```
#include <MCCLoader.h>
```

### Public Attributes

- const char \* **name**
- int **version**
- [Arc::MCC](#) \*(\* **get\_instance**)([Arc::Config](#) \*cfg, [Arc::ChainContext](#) \*ctx)

### 5.20.1 Detailed Description

Identifier of Message Chain Componet (MCC) plugin.

This structure describes one of the MCCs stored in a shared library. It contains name of plugin, version number and pointer to function which creates an instance of an object inherited from the MCC class.

The documentation for this struct was generated from the following file:

- MCCLoader.h

## 5.21 Arc::MCC\_Status Class Reference

A class for communication of [MCC](#) processing results.

```
#include <MCC_Status.h>
```

### Public Member Functions

- [MCC\\_Status](#) ([StatusKind](#) kind=STATUS\_UNDEFINED, const std::string &origin="???", const std::string &explanation="No explanation.")
- bool [isOk](#) () const
- [StatusKind](#) [getKind](#) () const
- const std::string & [getOrigin](#) () const
- const std::string & [getExplanation](#) () const
- [operator std::string](#) () const
- [operator bool](#) (void) const
- bool [operator!](#) (void) const

### 5.21.1 Detailed Description

A class for communication of [MCC](#) processing results.

This class is used to communicate result status between MCCs. It contains a status kind, a string specifying the origin ([MCC](#)) of the status object and an explanation.

### 5.21.2 Constructor & Destructor Documentation

#### 5.21.2.1 Arc::MCC\_Status::MCC\_Status ([StatusKind](#) kind = STATUS\_UNDEFINED, const std::string &origin = "???", const std::string &explanation = "No explanation.")

The constructor.

Creates a [MCC\\_Status](#) object.

#### Parameters:

- kind* The StatusKind (default: STATUS\_UNDEFINED)
- origin* The origin [MCC](#) (default: "??")
- explanation* An explanation (default: "No explanation.")

### 5.21.3 Member Function Documentation

#### 5.21.3.1 const std::string& Arc::MCC\_Status::getExplanation () const

Returns an explanation.

This method returns an explanation of this object.

#### Returns:

- An explanation of this object.

### 5.21.3.2 [StatusKind](#) Arc::MCC\_Status::getKind () const

Returns the status kind.

Returns the status kind of this object.

#### Returns:

The status kind of this object.

### 5.21.3.3 const std::string& Arc::MCC\_Status::getOrigin () const

Returns the origin.

This method returns a string specifying the origin [MCC](#) of this object.

#### Returns:

A string specifying the origin [MCC](#) of this object.

### 5.21.3.4 bool Arc::MCC\_Status::isOk () const

Is the status kind ok?

This method returns true iff the status kind of this object is STATUS\_OK

#### Returns:

true iff kind==STATUS\_OK

### 5.21.3.5 Arc::MCC\_Status::operator bool (void) const [inline]

Is the status kind ok?

This method returns true iff the status kind of this object is STATUS\_OK

#### Returns:

true iff kind==STATUS\_OK

### 5.21.3.6 Arc::MCC\_Status::operator std::string () const

Conversion to string.

This operator converts a [MCC\\_Status](#) object to a string.

### 5.21.3.7 bool Arc::MCC\_Status::operator! (void) const [inline]

not operator

Returns true if the status kind is not OK

#### Returns:

true if kind!=STATUS\_OK

The documentation for this class was generated from the following file:

- MCC\_Status.h

## 5.22 Arc::MCCFactory Class Reference

MCC Plugins handler.

```
#include <MCCFactory.h>
```

Inheritance diagram for Arc::MCCFactory::

### Public Member Functions

- [MCCFactory](#) ([Config](#) \*cfg)
- [MCC](#) \* [get\\_instance](#) (const std::string &name, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- [MCC](#) \* [get\\_instance](#) (const std::string &name, int version, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- [MCC](#) \* [get\\_instance](#) (const std::string &name, int min\_version, int max\_version, [Config](#) \*cfg, [ChainContext](#) \*ctx)

### 5.22.1 Detailed Description

MCC Plugins handler.

This class handles shared libraries containing MCCs

### 5.22.2 Constructor & Destructor Documentation

#### 5.22.2.1 Arc::MCCFactory::MCCFactory ([Config](#) \* *cfg*)

Constructor - accepts configuration (not yet used) meant to tune loading of module.

### 5.22.3 Member Function Documentation

#### 5.22.3.1 [MCC](#)\* Arc::MCCFactory::get\_instance (const std::string & *name*, [Config](#) \* *cfg*, [ChainContext](#) \* *ctx*)

These methods load shared library named lib'name', locate symbol representing descriptor of [MCC](#) and calls it's constructor function. Supplied configuration tree is passed to constructor. Returns created [MCC](#) instance.

Reimplemented from [Arc::LoaderFactory](#).

The documentation for this class was generated from the following file:

- MCCFactory.h

## 5.23 Arc::MCCInterface Class Reference

Interface for communication between [MCC](#), [Service](#) and [Plexer](#) objects.

```
#include <MCC.h>
```

Inheritance diagram for Arc::MCCInterface::

### Public Member Functions

- virtual [Arc::MCC\\_Status](#) [process](#) ([Arc::Message](#) &request, [Arc::Message](#) &response)=0

#### 5.23.1 Detailed Description

Interface for communication between [MCC](#), [Service](#) and [Plexer](#) objects.

The Interface is made of method [process\(\)](#) which is called by previous [MCC](#) in chain. For memory management policies please read description of [Message](#) class.

#### 5.23.2 Member Function Documentation

##### 5.23.2.1 virtual [Arc::MCC\\_Status](#) Arc::MCCInterface::process ([Arc::Message](#) & request, [Arc::Message](#) & response) [pure virtual]

Method for processing of requests and responses. This method is called by preceeding [MCC](#) in chain when a request needs to be processed. This method must call similar method of next [MCC](#) in chain unless any failure happens. Result returned by call to next [MCC](#) should be processed and passed back to previous [MCC](#). In case of failure this method is expected to generate valid error response and return it back to previous [MCC](#) without calling the next one.

##### Parameters:

*request* The request that needs to be processed.

*response* A [Message](#) object that will contain the response of the request when the method returns.

##### Returns:

An object representing the status of the call.

Implemented in [Arc::Plexer](#).

The documentation for this class was generated from the following file:

- MCC.h

## 5.24 Arc::Message Class Reference

Object being passed through chain of MCCs.

```
#include <Message.h>
```

### Public Member Functions

- [Message](#) (void)
- [Message](#) ([Message](#) &msg)
- [~Message](#) (void)
- [Message](#) & [operator=](#) ([Message](#) &msg)
- [MessagePayload](#) \* [Payload](#) (void)
- [MessagePayload](#) \* [Payload](#) ([MessagePayload](#) \*new\_payload)
- [MessageAttributes](#) \* [Attributes](#) (void)
- void [Attributes](#) ([MessageAttributes](#) \*attributes)
- [MessageAuth](#) \* [Auth](#) (void)
- void [Auth](#) ([MessageAuth](#) \*auth)
- [MessageContext](#) \* [Context](#) (void)
- void [Context](#) ([MessageContext](#) \*context)

### 5.24.1 Detailed Description

Object being passed through chain of MCCs.

An instance of this class refers to objects with main content ([MessagePayload](#)), authentication/authorization information ([MessageAuth](#)) and common purpose attributes ([MessageAttributes](#)). [Message](#) class does not manage pointers to objects and their content. It only serves for grouping those objects. [Message](#) objects are supposed to be processed by MCCs and Services implementing [MCCInterface](#) method [process\(\)](#). All objects constituting content of [Message](#) object are subject to following policies:

1. All objects created inside call to [process\(\)](#) method using new command must be explicitly destroyed within same call using delete command with following exceptions. a) Objects which are assigned to 'response' [Message](#). b) Objects whose management is completely acquired by objects assigned to 'response' [Message](#).
2. All objects not created inside call to [process\(\)](#) method are not explicitly destroyed within that call with following exception. a) Objects which are part of 'response' Method returned from call to next's [process\(\)](#) method. Unless those objects are passed further to calling [process\(\)](#), of course.
3. It is not allowed to make 'response' point to same objects as 'request' does on entry to [process\(\)](#) method. That is needed to avoid double destruction of same object. (Note: if in a future such need arises it may be solved by storing additional flags in [Message](#) object).
4. It is allowed to change content of pointers of 'request' [Message](#). Calling [process\(\)](#) method must not rely on that object to stay intact.
5. Called [process\(\)](#) method should either fill 'response' [Message](#) with pointers to valid objects or to keep them intact. This makes it possible for calling [process\(\)](#) to preload 'response' with valid error message.

### 5.24.2 Constructor & Destructor Documentation

#### 5.24.2.1 Arc::Message::Message (void) [inline]

Dummy constructor

#### 5.24.2.2 Arc::Message::Message (Message & msg) [inline]

Copy constructor. Ensures shallow copy.

#### 5.24.2.3 Arc::Message::~Message (void) [inline]

Destructor does not affect referred objects

### 5.24.3 Member Function Documentation

#### 5.24.3.1 MessageAttributes\* Arc::Message::Attributes (void) [inline]

Returns a pointer to the current attributes object or NULL if no attributes object has been assigned.

#### 5.24.3.2 MessageAuth\* Arc::Message::Auth (void) [inline]

Returns a pointer to the current authentication/authorization object or NULL if no object has been assigned.

#### 5.24.3.3 void Arc::Message::Context (MessageContext \* context) [inline]

Assigns message context object

#### 5.24.3.4 MessageContext\* Arc::Message::Context (void) [inline]

Returns a pointer to the current context object or NULL if no object has been assigned. Last case can happen only if first MCC in a chain is connectionless like one implementing UDP protocol.

#### 5.24.3.5 Message& Arc::Message::operator= (Message & msg) [inline]

Assignment. Ensures shallow copy.

#### 5.24.3.6 MessagePayload\* Arc::Message::Payload (MessagePayload \* new\_payload) [inline]

Replaces payload with new one. Returns the old one.

#### 5.24.3.7 MessagePayload\* Arc::Message::Payload (void) [inline]

Returns pointer to current payload or NULL if no payload assigned.

The documentation for this class was generated from the following file:

- Message.h

## 5.25 Arc::MessageAttributes Class Reference

A class for storage of attribute values.

```
#include <MessageAttributes.h>
```

### Public Member Functions

- [MessageAttributes](#) ()
- void [set](#) (const std::string &key, const std::string &value)
- void [add](#) (const std::string &key, const std::string &value)
- void [removeAll](#) (const std::string &key)
- void [remove](#) (const std::string &key, const std::string &value)
- int [count](#) (const std::string &key) const
- const std::string & [get](#) (const std::string &key) const
- [AttributeIterator](#) [getAll](#) (const std::string &key) const

### Protected Attributes

- [AttrMap](#) [attributes\\_](#)

#### 5.25.1 Detailed Description

A class for storage of attribute values.

This class is used to store attributes of messages. All attribute keys and their corresponding values are stored as strings. Any key or value that is not a string must thus be represented as a string during storage. Furthermore, an attribute is usually a key-value pair with a unique key, but there may also be multiple such pairs with equal keys.

The key of an attribute is composed by the name of the [Message](#) Chain Component ([MCC](#)) which produce it and the name of the attribute itself with a colon (:) in between, i.e. MCC\_Name:Attribute\_Name. For example, the key of the "Content-Length" attribute of the HTTP [MCC](#) is thus "HTTP:Content-Length".

There are also "global attributes", which may be produced by different MCCs depending on the configuration. The keys of such attributes are NOT prefixed by the name of the producing [MCC](#). Before any new global attribute is introduced, it must be agreed upon by the core development team and added below. The global attributes decided so far are:

- [Request-URI](#) Identifies the service to which the message shall be sent. This attribute is produced by e.g. the HTTP [MCC](#) and used by the plexer for routing the message to the appropriate service.

#### 5.25.2 Constructor & Destructor Documentation

##### 5.25.2.1 Arc::MessageAttributes::MessageAttributes ()

The default constructor.

This is the default constructor of the [MessageAttributes](#) class. It constructs an empty object that initially contains no attributes.

### 5.25.3 Member Function Documentation

#### 5.25.3.1 void Arc::MessageAttributes::add (const std::string & *key*, const std::string & *value*)

Adds a value to an attribute.

This method adds a new value to an attribute. Any previous value will be preserved, i.e. the attribute may become multiple valued.

**Parameters:**

*key* The key of the attribute.

*value* The (new) value of the attribute.

#### 5.25.3.2 int Arc::MessageAttributes::count (const std::string & *key*) const

Returns the number of values of an attribute.

Returns the number of values of an attribute that matches a certain key.

**Parameters:**

*key* The key of the attribute for which to count values.

**Returns:**

The number of values that corresponds to the key.

#### 5.25.3.3 const std::string& Arc::MessageAttributes::get (const std::string & *key*) const

Returns the value of a single-valued attribute.

This method returns the value of a single-valued attribute. If the attribute is not single valued (i.e. there is no such attribute or it is a multiple-valued attribute) an empty string is returned.

**Parameters:**

*key* The key of the attribute for which to return the value.

**Returns:**

The value of the attribute.

#### 5.25.3.4 [AttributeIterator](#) Arc::MessageAttributes::getAll (const std::string & *key*) const

Access the value(s) of an attribute.

This method returns an [AttributeIterator](#) that can be used to access the values of an attribute.

**Parameters:**

*key* The key of the attribute for which to return the values.

**Returns:**

An [AttributeIterator](#) for access of the values of the attribute.

**5.25.3.5 void Arc::MessageAttributes::remove (const std::string & *key*, const std::string & *value*)**

Removes one value of an attribute.

This method removes a certain value from the attribute that matches a certain key.

**Parameters:**

*key* The key of the attribute from which the value shall be removed.

*value* The value to remove.

**5.25.3.6 void Arc::MessageAttributes::removeAll (const std::string & *key*)**

Removes all attributes with a certain key.

This method removes all attributes that match a certain key.

**Parameters:**

*key* The key of the attributes to remove.

**5.25.3.7 void Arc::MessageAttributes::set (const std::string & *key*, const std::string & *value*)**

Sets a unique value of an attribute.

This method removes any previous value of an attribute and sets the new value as the only value.

**Parameters:**

*key* The key of the attribute.

*value* The (new) value of the attribute.

**5.25.4 Member Data Documentation****5.25.4.1 [AttrMap Arc::MessageAttributes::attributes\\_](#) [protected]**

Internal storage of attributes.

An AttrMap (multimap) in which all attributes (key-value pairs) are stored.

The documentation for this class was generated from the following file:

- MessageAttributes.h

## 5.26 Arc::MessageAuth Class Reference

Contains authenticity information, authorization tokens and decisions.

```
#include <MessageAuth.h>
```

### Public Member Functions

- void **set** (const std::string &key, const AuthObject &value)
- AuthObject **get** (const std::string &key, int index=0)
- void **remove** (const std::string &key)

### 5.26.1 Detailed Description

Contains authenticity information, authorization tokens and decisions.

Functionality of this class is not defined yet.

The documentation for this class was generated from the following file:

- MessageAuth.h

## 5.27 Arc::MessageContext Class Reference

Handler for context of message context.

```
#include <Message.h>
```

### Public Member Functions

- void [Add](#) (const std::string &name, [MessageContextElement](#) \*element)
- [MessageContextElement](#) \* [operator\[\]](#) (const std::string &id)

### 5.27.1 Detailed Description

Handler for context of message context.

This class is a container for objects derived from [MessageContextElement](#). It gets associated with [Message](#) object usually by first [MCC](#) in a chain and is kept as long as connection persists.

### 5.27.2 Member Function Documentation

#### 5.27.2.1 void Arc::MessageContext::Add (const std::string & *name*, [MessageContextElement](#) \* *element*)

Provided element is taken over by this class. It is remembered by it and destroyed when this class is destroyed.

The documentation for this class was generated from the following file:

- Message.h

## 5.28 Arc::MessageContextElement Class Reference

Top class for elements contained in message context.

```
#include <Message.h>
```

### 5.28.1 Detailed Description

Top class for elements contained in message context.

Objects of classes inherited with this one may be stored in [MessageContext](#) container.

The documentation for this class was generated from the following file:

- Message.h

## 5.29 Arc::MessagePayload Class Reference

Base class for content of message passed through chain.

```
#include <Message.h>
```

Inheritance diagram for Arc::MessagePayload::

### 5.29.1 Detailed Description

Base class for content of message passed through chain.

It's not intended to be used directly. Instead functional classes must be derived from it.

The documentation for this class was generated from the following file:

- Message.h

## 5.30 Arc::ModuleManager Class Reference

Manager of shared libraries.

```
#include <ModuleManager.h>
```

Inheritance diagram for Arc::ModuleManager::

### Public Member Functions

- [ModuleManager](#) ([Arc::Config](#) \*cfg)
- Glib::Module \* [load](#) (const std::string &name)

#### 5.30.1 Detailed Description

Manager of shared libraries.

This class loads shared libraries/modules. There supposed to be created one instance of it per executable. In such circumstances it would cache handles to loaded modules and not load them multiple times.

#### 5.30.2 Constructor & Destructor Documentation

##### 5.30.2.1 Arc::ModuleManager::ModuleManager ([Arc::Config](#) \* cfg)

Constructor. It is supposed to process correpoding configuration subtree and tune module loading parameters accordingly. Currently it only sets modlur directory to current one.

#### 5.30.3 Member Function Documentation

##### 5.30.3.1 Glib::Module\* Arc::ModuleManager::load (const std::string & name)

Finds module 'name' in cache or loads corresponding shared library

The documentation for this class was generated from the following file:

- ModuleManager.h

## 5.31 Arc::PayloadRaw Class Reference

Raw byte multi-buffer.

```
#include <PayloadRaw.h>
```

Inheritance diagram for Arc::PayloadRaw::

### Public Member Functions

- [PayloadRaw](#) (void)
- virtual [~PayloadRaw](#) (void)
- virtual char [operator\[\]](#) (int pos) const
- virtual char \* [Content](#) (int pos=-1)
- virtual int [Size](#) (void) const
- virtual char \* [Insert](#) (int pos=0, int size=0)
- virtual char \* [Insert](#) (const char \*s, int pos=0, int size=0)
- virtual char \* [Buffer](#) (unsigned int num=0)
- virtual int [BufferSize](#) (unsigned int num=0) const
- virtual int [BufferPos](#) (unsigned int num=0) const
- virtual bool [Truncate](#) (unsigned int size)

### Protected Attributes

- int [offset\\_](#)
- int [size\\_](#)
- std::vector< PayloadRawBuf > [buf\\_](#)

#### 5.31.1 Detailed Description

Raw byte multi-buffer.

This is implementation of [PayloadRawInterface](#). Buffers are memory blocks logically placed one after another.

#### 5.31.2 Constructor & Destructor Documentation

##### 5.31.2.1 Arc::PayloadRaw::PayloadRaw (void) [inline]

Constructor. Created object contains no buffers.

**5.31.2.2 virtual Arc::PayloadRaw::~~PayloadRaw (void) [virtual]**

Destructor. Frees allocated buffers.

**5.31.3 Member Function Documentation****5.31.3.1 virtual char\* Arc::PayloadRaw::Buffer (unsigned int *num* = 0) [virtual]**

Returns pointer to num'th buffer

Implements [Arc::PayloadRawInterface](#).

**5.31.3.2 virtual int Arc::PayloadRaw::BufferPos (unsigned int *num* = 0) const [virtual]**

Returns position of num'th buffer

Implements [Arc::PayloadRawInterface](#).

**5.31.3.3 virtual int Arc::PayloadRaw::BufferSize (unsigned int *num* = 0) const [virtual]**

Returns length of num'th buffer

Implements [Arc::PayloadRawInterface](#).

**5.31.3.4 virtual char\* Arc::PayloadRaw::Content (int *pos* = -1) [virtual]**

Get pointer to buffer content at global position 'pos'. By default to beginning of main buffer whatever that means.

Implements [Arc::PayloadRawInterface](#).

**5.31.3.5 virtual char\* Arc::PayloadRaw::Insert (const char \* *s*, int *pos* = 0, int *size* = 0) [virtual]**

Create new buffer at global position 'pos' of size 'size'. Created buffer is filled with content of memory at 's'. If 'size' is 0 content at 's' is expected to be null-terminated.

Implements [Arc::PayloadRawInterface](#).

**5.31.3.6 virtual char\* Arc::PayloadRaw::Insert (int *pos* = 0, int *size* = 0) [virtual]**

Create new buffer at global position 'pos' of size 'size'.

Implements [Arc::PayloadRawInterface](#).

**5.31.3.7 ]**

virtual char Arc::PayloadRaw::operator[] (int *pos*) const [virtual]

Returns content of byte at specified position. Specified position 'pos' is treated as global one and goes through all buffers placed one after another.

Implements [Arc::PayloadRawInterface](#).

**5.31.3.8 virtual int Arc::PayloadRaw::Size (void) const** [virtual]

Returns logical size of whole structure.

Implements [Arc::PayloadRawInterface](#).

**5.31.3.9 virtual bool Arc::PayloadRaw::Truncate (unsigned int *size*)** [virtual]

Change size of stored information. If size exceeds end of allocated buffer, buffers are not re-allocated, only logical size is extended. Buffers with location behind new size are deallocated.

Implements [Arc::PayloadRawInterface](#).

The documentation for this class was generated from the following file:

- PayloadRaw.h

## 5.32 Arc::PayloadRawInterface Class Reference

Random Access Payload for [Message](#) objects.

```
#include <PayloadRaw.h>
```

Inheritance diagram for Arc::PayloadRawInterface::

### Public Member Functions

- virtual char [operator\[\]](#) (int pos) const =0
- virtual char \* [Content](#) (int pos=-1)=0
- virtual int [Size](#) (void) const =0
- virtual char \* [Insert](#) (int pos=0, int size=0)=0
- virtual char \* [Insert](#) (const char \*s, int pos=0, int size=0)=0
- virtual char \* [Buffer](#) (unsigned int num)=0
- virtual int [BufferSize](#) (unsigned int num) const =0
- virtual int [BufferPos](#) (unsigned int num) const =0
- virtual bool [Truncate](#) (unsigned int size)=0

### 5.32.1 Detailed Description

Random Access Payload for [Message](#) objects.

This class is a virtual interface for managing [Message](#) payload with arbitrarily accessible content. Inheriting classes are supposed to implement memory-resident or memory-mapped content made of optionally multiple chunks/buffers. Every buffer has own size and offset. This class is purely virtual.

### 5.32.2 Member Function Documentation

#### 5.32.2.1 virtual char\* Arc::PayloadRawInterface::Buffer (unsigned int *num*) [pure virtual]

Returns pointer to num'th buffer

Implemented in [Arc::PayloadRaw](#).

#### 5.32.2.2 virtual int Arc::PayloadRawInterface::BufferPos (unsigned int *num*) const [pure virtual]

Returns position of num'th buffer

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.3 `virtual int Arc::PayloadRawInterface::BufferSize (unsigned int num) const` [pure virtual]

Returns length of *num*'th buffer

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.4 `virtual char* Arc::PayloadRawInterface::Content (int pos = -1)` [pure virtual]

Get pointer to buffer content at global position '*pos*'. By default to beginning of main buffer whatever that means.

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.5 `virtual char* Arc::PayloadRawInterface::Insert (const char * s, int pos = 0, int size = 0)` [pure virtual]

Create new buffer at global position '*pos*' of size '*size*'. Created buffer is filled with content of memory at '*s*'. If '*size*' is 0 content at '*s*' is expected to be null-terminated.

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.6 `virtual char* Arc::PayloadRawInterface::Insert (int pos = 0, int size = 0)` [pure virtual]

Create new buffer at global position '*pos*' of size '*size*'.

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.7 ]

`virtual char Arc::PayloadRawInterface::operator[] (int pos) const` [pure virtual]

Returns content of byte at specified position. Specified position '*pos*' is treated as global one and goes through all buffers placed one after another.

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.8 `virtual int Arc::PayloadRawInterface::Size (void) const` [pure virtual]

Returns logical size of whole structure.

Implemented in [Arc::PayloadRaw](#).

### 5.32.2.9 `virtual bool Arc::PayloadRawInterface::Truncate (unsigned int size)` [pure virtual]

Change size of stored information. If size exceeds end of allocated buffer, buffers are not re-allocated, only logical size is extended. Buffers with location behind new size are deallocated.

Implemented in [Arc::PayloadRaw](#).

The documentation for this class was generated from the following file:

- PayloadRaw.h

## 5.33 Arc::PayloadSOAP Class Reference

Payload of [Message](#) with SOAP content.

```
#include <PayloadSOAP.h>
```

Inheritance diagram for Arc::PayloadSOAP::

### Public Member Functions

- [PayloadSOAP](#) (const Arc::NS &ns, bool fault=false)
- [PayloadSOAP](#) (const Arc::SOAPEnvelope &soap)
- [PayloadSOAP](#) (const Arc::MessagePayload &source)

### 5.33.1 Detailed Description

Payload of [Message](#) with SOAP content.

This class combines [MessagePayload](#) with [SOAPEnvelope](#) to make it possible to pass SOAP messages through [MCC](#) chain.

### 5.33.2 Constructor & Destructor Documentation

#### 5.33.2.1 Arc::PayloadSOAP::PayloadSOAP (const Arc::NS & ns, bool *fault* = false)

Constructor - creates new [Message](#) payload

#### 5.33.2.2 Arc::PayloadSOAP::PayloadSOAP (const Arc::SOAPEnvelope & soap)

Constructor - creates [Message](#) payload from SOAP document. Provided SOAP document must exist as long as created object exists.

#### 5.33.2.3 Arc::PayloadSOAP::PayloadSOAP (const Arc::MessagePayload & source)

Constructor - creates SOAP message from payload. [PayloadRawInterface](#) and derived classes are supported.

The documentation for this class was generated from the following file:

- PayloadSOAP.h

## 5.34 Arc::PayloadStream Class Reference

POSIX handle as Payload.

```
#include <PayloadStream.h>
```

Inheritance diagram for Arc::PayloadStream::

### Public Member Functions

- [PayloadStream](#) (int h=-1)
- virtual [~PayloadStream](#) (void)
- virtual bool [Get](#) (char \*buf, int &size)
- virtual bool [Get](#) (std::string &buf)
- virtual std::string [Get](#) (void)
- virtual bool [Put](#) (const char \*buf, int size)
- virtual bool [Put](#) (const std::string &buf)
- virtual bool [Put](#) (const char \*buf)
- virtual [operator bool](#) (void)
- virtual bool [operator!](#) (void)
- virtual int [Timeout](#) (void) const
- virtual void [Timeout](#) (int to)
- virtual int [GetHandle](#) (void)

### Protected Attributes

- int [timeout\\_](#)
- int [handle\\_](#)
- bool [seekable\\_](#)

#### 5.34.1 Detailed Description

POSIX handle as Payload.

This is an implementation of [PayloadStreamInterface](#) for generic POSIX handle.

#### 5.34.2 Constructor & Destructor Documentation

##### 5.34.2.1 Arc::PayloadStream::PayloadStream (int h = -1)

Constructor. Attaches to already open handle. Handle is not managed by this class and must be closed by external code.

**5.34.2.2 virtual Arc::PayloadStream::~~PayloadStream (void)** [inline, virtual]

Destructor.

**5.34.3 Member Function Documentation****5.34.3.1 virtual std::string Arc::PayloadStream::Get (void)** [inline, virtual]

Read as many as possible (sane amount) of bytes.

Implements [Arc::PayloadStreamInterface](#).

**5.34.3.2 virtual bool Arc::PayloadStream::Get (std::string & buf)** [virtual]

Read as many as possible (sane amount) of bytes into buf.

Implements [Arc::PayloadStreamInterface](#).

**5.34.3.3 virtual bool Arc::PayloadStream::Get (char \* buf, int & size)** [virtual]

Extracts information from stream up to 'size' bytes. 'size' contains number of read bytes on exit. Returns true in case of success.

Implements [Arc::PayloadStreamInterface](#).

**5.34.3.4 virtual int Arc::PayloadStream::GetHandle (void)** [inline, virtual]

Returns POSIX handle of the stream. This method is deprecated and will be removed soon. Currently it is only used by Transport Layer Security [MCC](#).

**5.34.3.5 virtual Arc::PayloadStream::operator bool (void)** [inline, virtual]

Returns true if stream is valid.

Implements [Arc::PayloadStreamInterface](#).

**5.34.3.6 virtual bool Arc::PayloadStream::operator! (void)** [inline, virtual]

Returns true if stream is invalid.

Implements [Arc::PayloadStreamInterface](#).

**5.34.3.7 virtual bool Arc::PayloadStream::Put (const char \* buf)** [inline, virtual]

Push null terminated information from 'buf' into stream. Returns true on success.

Implements [Arc::PayloadStreamInterface](#).

**5.34.3.8 virtual bool Arc::PayloadStream::Put (const std::string & buf)** [inline, virtual]

Push information from 'buf' into stream. Returns true on success.

Implements [Arc::PayloadStreamInterface](#).

#### 5.34.3.9 virtual bool Arc::PayloadStream::Put (const char \* *buf*, int *size*) [virtual]

Push 'size' bytes from 'buf' into stream. Returns true on success.

Implements [Arc::PayloadStreamInterface](#).

#### 5.34.3.10 virtual void Arc::PayloadStream::Timeout (int *to*) [inline, virtual]

Set current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implements [Arc::PayloadStreamInterface](#).

#### 5.34.3.11 virtual int Arc::PayloadStream::Timeout (void) const [inline, virtual]

Query current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implements [Arc::PayloadStreamInterface](#).

### 5.34.4 Member Data Documentation

#### 5.34.4.1 int Arc::PayloadStream::handle\_ [protected]

Timeout for read/write operations

#### 5.34.4.2 bool Arc::PayloadStream::seekable\_ [protected]

Handle for operations

The documentation for this class was generated from the following file:

- PayloadStream.h

## 5.35 Arc::PayloadStreamInterface Class Reference

Stream-like Payload for [Message](#) object.

```
#include <PayloadStream.h>
```

Inheritance diagram for Arc::PayloadStreamInterface::

### Public Member Functions

- virtual bool [Get](#) (char \*buf, int &size)=0
- virtual bool [Get](#) (std::string &buf)=0
- virtual std::string [Get](#) (void)=0
- virtual bool [Put](#) (const char \*buf, int size)=0
- virtual bool [Put](#) (const std::string &buf)=0
- virtual bool [Put](#) (const char \*buf)=0
- virtual [operator bool](#) (void)=0
- virtual bool [operator!](#) (void)=0
- virtual int [Timeout](#) (void) const =0
- virtual void [Timeout](#) (int to)=0

### 5.35.1 Detailed Description

Stream-like Payload for [Message](#) object.

This class is a virtual interface for managing stream-like source and destination. It's supposed to be passed through [MCC](#) chain as payload of [Message](#). It must be treated by MCCs and Services as dynamic payload. This class is purely virtual.

### 5.35.2 Member Function Documentation

#### 5.35.2.1 virtual std::string Arc::PayloadStreamInterface::Get (void) [pure virtual]

Read as many as possible (sane amount) of bytes.

Implemented in [Arc::PayloadStream](#).

#### 5.35.2.2 virtual bool Arc::PayloadStreamInterface::Get (std::string & buf) [pure virtual]

Read as many as possible (sane amount) of bytes into buf.

Implemented in [Arc::PayloadStream](#).

**5.35.2.3 virtual bool Arc::PayloadStreamInterface::Get (char \* *buf*, int & *size*)** [pure virtual]

Extracts information from stream up to 'size' bytes. 'size' contains number of read bytes on exit. Returns true in case of success.

Implemented in [Arc::PayloadStream](#).

**5.35.2.4 virtual Arc::PayloadStreamInterface::operator bool (void)** [pure virtual]

Returns true if stream is valid.

Implemented in [Arc::PayloadStream](#).

**5.35.2.5 virtual bool Arc::PayloadStreamInterface::operator! (void)** [pure virtual]

Returns true if stream is invalid.

Implemented in [Arc::PayloadStream](#).

**5.35.2.6 virtual bool Arc::PayloadStreamInterface::Put (const char \* *buf*)** [pure virtual]

Push null terminated information from 'buf' into stream. Returns true on success.

Implemented in [Arc::PayloadStream](#).

**5.35.2.7 virtual bool Arc::PayloadStreamInterface::Put (const std::string & *buf*)** [pure virtual]

Push information from 'buf' into stream. Returns true on success.

Implemented in [Arc::PayloadStream](#).

**5.35.2.8 virtual bool Arc::PayloadStreamInterface::Put (const char \* *buf*, int *size*)** [pure virtual]

Push 'size' bytes from 'buf' into stream. Returns true on success.

Implemented in [Arc::PayloadStream](#).

**5.35.2.9 virtual void Arc::PayloadStreamInterface::Timeout (int *to*)** [pure virtual]

Set current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implemented in [Arc::PayloadStream](#).

**5.35.2.10 virtual int Arc::PayloadStreamInterface::Timeout (void) const** [pure virtual]

Query current timeout for [Get\(\)](#) and [Put\(\)](#) operations.

Implemented in [Arc::PayloadStream](#).

The documentation for this class was generated from the following file:

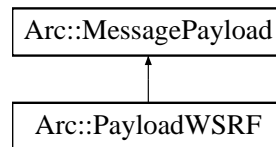

- PayloadStream.h

## 5.36 Arc::PayloadWSRF Class Reference

This class combines [MessagePayload](#) with [WSRF](#).

```
#include <PayloadWSRF.h>
```

Inheritance diagram for Arc::PayloadWSRF::

### Public Member Functions

- [PayloadWSRF](#) (const [SOAPEnvelope](#) &soap)
- [PayloadWSRF](#) ([WSRF](#) &wsrp)
- [PayloadWSRF](#) (const [MessagePayload](#) &source)
- **operator WSRF &** (void)
- **operator bool** (void)

### Protected Attributes

- [WSRF](#) & **wsrf\_**
- bool **owner\_**

#### 5.36.1 Detailed Description

This class combines [MessagePayload](#) with [WSRF](#).

It's intention is to make it possible to pass [WSRF](#) messages through [MCC](#) chain as one more Payload type.

#### 5.36.2 Constructor & Destructor Documentation

##### 5.36.2.1 Arc::PayloadWSRF::PayloadWSRF (const [SOAPEnvelope](#) & soap)

Constructor - creates [Message](#) payload from SOAP message. Returns invalid [WSRF](#) if SOAP does not represent WS-ResourceProperties

##### 5.36.2.2 Arc::PayloadWSRF::PayloadWSRF ([WSRF](#) & *wsrp*)

Constructor - creates [Message](#) payload with acquired [WSRF](#) message. [WSRF](#) message will be destroyed by destructor of this object.

##### 5.36.2.3 Arc::PayloadWSRF::PayloadWSRF (const [MessagePayload](#) & *source*)

Constructor - creates [WSRF](#) message from payload. All classes derived from [SOAPEnvelope](#) are supported.

The documentation for this class was generated from the following file:

- PayloadWSRF.h

## 5.37 pdp\_descriptor Struct Reference

Identifier of Policy Decision Point (PDP) plugin.

```
#include <PDPLoader.h>
```

### Public Attributes

- const char \* **name**
- int **version**
- Arc::PDP \*(\* **get\_instance**)(Arc::Config \*cfg, Arc::ChainContext \*ctx)

### 5.37.1 Detailed Description

Identifier of Policy Decision Point (PDP) plugin.

This structure describes one of the PDPs stored in a shared library. It contains name of plugin, version number and pointer to function which creates an instance of an object inherited from the PDP class.

The documentation for this struct was generated from the following file:

- PDPLoader.h

## 5.38 Arc::PDPFactory Class Reference

PDP Plugins handler.

```
#include <PDPFactory.h>
```

Inheritance diagram for Arc::PDPFactory::

### Public Member Functions

- [PDPFactory](#) ([Config](#) \*cfg)
- PDP \* [get\\_instance](#) (const std::string &name, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- PDP \* [get\\_instance](#) (const std::string &name, int version, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- PDP \* [get\\_instance](#) (const std::string &name, int min\_version, int max\_version, [Config](#) \*cfg, [ChainContext](#) \*ctx)

### 5.38.1 Detailed Description

PDP Plugins handler.

This class handles shared libraries containing PDPs

### 5.38.2 Constructor & Destructor Documentation

#### 5.38.2.1 Arc::PDPFactory::PDPFactory ([Config](#) \* cfg)

Constructor - accepts configuration (not yet used) meant to tune loading of module.

### 5.38.3 Member Function Documentation

#### 5.38.3.1 PDP\* Arc::PDPFactory::get\_instance (const std::string & name, [Config](#) \* cfg, [ChainContext](#) \* ctx)

These methods load shared library named lib'name', locate symbol representing descriptor of PDP and calls it's constructor function. Supplied configuration tree is passed to constructor. Returns created PDP instance.

Reimplemented from [Arc::LoaderFactory](#).

The documentation for this class was generated from the following file:

- PDPFactory.h

## 5.39 Arc::Plexer Class Reference

The [Plexer](#) class, used for routing messages to services.

```
#include <Plexer.h>
```

Inheritance diagram for Arc::Plexer::

### Public Member Functions

- [Plexer](#) ([Config](#) \*cfg)
- virtual [~Plexer](#) ()
- virtual void [Next](#) ([MCCInterface](#) \*next, const std::string &label)
- virtual [MCC\\_Status](#) process ([Message](#) &request, [Message](#) &response)

### Static Protected Attributes

- static [Arc::Logger](#) logger

#### 5.39.1 Detailed Description

The [Plexer](#) class, used for routing messages to services.

This is the [Plexer](#) class. Its purpose is to route incoming messages to appropriate Services and [MCC](#) chains.

#### 5.39.2 Constructor & Destructor Documentation

##### 5.39.2.1 Arc::Plexer::Plexer ([Config](#) \* cfg)

The constructor.

This is the constructor. Since all member variables are instances of "well-behaving" STL classes, nothing needs to be done.

##### 5.39.2.2 virtual Arc::Plexer::~~Plexer () [virtual]

The destructor.

This is the destructor. Since all member variables are instances of "well-behaving" STL classes, nothing needs to be done.

### 5.39.3 Member Function Documentation

#### 5.39.3.1 virtual void Arc::Plexer::Next ([MCCInterface](#) \* *next*, const std::string & *label*) [virtual]

Add reference to next [MCC](#) in chain.

This method is called by [Loader](#) for every potentially labeled link to next component which implements [MCCInterface](#). If next is set NULL corresponding link is removed.

Reimplemented from [Arc::MCC](#).

#### 5.39.3.2 virtual [MCC\\_Status](#) Arc::Plexer::process ([Message](#) & *request*, [Message](#) & *response*) [virtual]

Rout request messages to appropriate services.

Routs the request message to the appropriate service. Currently routing is based on the value of the "Request-URI" attribute, but that may be replaced by some other attribute once the attributes discussion is finished.

Implements [Arc::MCCInterface](#).

### 5.39.4 Member Data Documentation

#### 5.39.4.1 [Arc::Logger](#) Arc::Plexer::logger [static, protected]

A logger for MCCs.

A logger intended to be the parent of loggers in the different MCCs.

Reimplemented from [Arc::MCC](#).

The documentation for this class was generated from the following file:

- Plexer.h

## 5.40 Arc::PlexerEntry Class Reference

A pair of label (regex) and pointer to service.

```
#include <Plexer.h>
```

### Friends

- class **Plexer**

### 5.40.1 Detailed Description

A pair of label (regex) and pointer to service.

A helper class that stores a label (regex) and a pointer to a service.

The documentation for this class was generated from the following file:

- Plexer.h

## 5.41 Arc::RegularExpression Class Reference

A regular expression class.

```
#include <Plexer.h>
```

### Public Member Functions

- [RegularExpression](#) (std::string pattern)
- [RegularExpression](#) (const [RegularExpression](#) &regex)
- [~RegularExpression](#) ()
- const [RegularExpression](#) & [operator=](#) (const [RegularExpression](#) &regex)
- bool [isOk](#) ()
- bool [hasPattern](#) (std::string str)
- bool [match](#) (const std::string &str) const
- bool [match](#) (const std::string &str, std::list< std::string > &unmatched) const
- std::string [getPattern](#) ()

### 5.41.1 Detailed Description

A regular expression class.

This class is a wrapper around the functions provided in regex.h.

### 5.41.2 Constructor & Destructor Documentation

#### 5.41.2.1 Arc::RegularExpression::RegularExpression (std::string *pattern*)

Creates a regex from a pattern string.

#### 5.41.2.2 Arc::RegularExpression::RegularExpression (const [RegularExpression](#) & *regex*)

Copy constructor.

#### 5.41.2.3 Arc::RegularExpression::~~RegularExpression ()

Destructor.

### 5.41.3 Member Function Documentation

#### 5.41.3.1 std::string Arc::RegularExpression::getPattern ()

Returns patter.

#### 5.41.3.2 bool Arc::RegularExpression::hasPattern (std::string *str*)

Returns true if this regex has the pattern provided.

**5.41.3.3 bool Arc::RegularExpression::isOk ()**

Returns true if the pattern of this regex is ok.

**5.41.3.4 bool Arc::RegularExpression::match (const std::string & *str*, std::list< std::string > & *unmatched*) const**

Returns true if this regex matches the string provided. Unmatched parts of the string are stored in 'unmatched'.

**5.41.3.5 bool Arc::RegularExpression::match (const std::string & *str*) const**

Returns true if this regex matches whole string provided.

**5.41.3.6 const [RegularExpression](#)& Arc::RegularExpression::operator= (const [RegularExpression](#) & *regex*)**

Assignment operator.

The documentation for this class was generated from the following file:

- Plexer.h

## 5.42 Arc::SecHandlerFactory Class Reference

SecHandler Plugins handler.

```
#include <SecHandlerFactory.h>
```

Inheritance diagram for Arc::SecHandlerFactory::

### Public Member Functions

- [SecHandlerFactory](#) ([Config](#) \*cfg)
- SecHandler \* [get\\_instance](#) (const std::string &name, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- SecHandler \* [get\\_instance](#) (const std::string &name, int version, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- SecHandler \* [get\\_instance](#) (const std::string &name, int min\_version, int max\_version, [Config](#) \*cfg, [ChainContext](#) \*ctx)

### 5.42.1 Detailed Description

SecHandler Plugins handler.

This class handles shared libraries containing SecHandlers

### 5.42.2 Constructor & Destructor Documentation

#### 5.42.2.1 Arc::SecHandlerFactory::SecHandlerFactory ([Config](#) \* cfg)

Constructor - accepts configuration (not yet used) meant to tune loading of module.

### 5.42.3 Member Function Documentation

#### 5.42.3.1 SecHandler\* Arc::SecHandlerFactory::get\_instance (const std::string & name, [Config](#) \* cfg, [ChainContext](#) \* ctx)

These methods load shared library named lib'name', locate symbol representing descriptor of SecHandler and calls it's constructor function. Supplied configuration tree is passed to constructor. Returns created SecHandler instance.

Reimplemented from [Arc::LoaderFactory](#).

The documentation for this class was generated from the following file:

- SecHandlerFactory.h

## 5.43 Arc::Service Class Reference

[Service](#) - last component in a [Message](#) Chain.

```
#include <Service.h>
```

Inheritance diagram for Arc::Service::

### Public Member Functions

- [Service](#) ([Arc::Config](#) \*cfg \_\_attribute\_\_((unused)))
- virtual void [AddSecHandler](#) ([Arc::Config](#) \*cfg, Arc::SecHandler \*sechandler, const std::string &label="")

### Protected Attributes

- std::map< std::string, std::list< Arc::SecHandler \* > > [sechandlers\\_](#)

### Static Protected Attributes

- static [Logger](#) [logger](#)

#### 5.43.1 Detailed Description

[Service](#) - last component in a [Message](#) Chain.

This is virtual class which defines interface (in a future also common functionality) for every [Service](#) plugin. Interface is made of method [process\(\)](#) which is called by [Plexer](#) or [MCC](#) class. There is one [Service](#) object created for every service description processed by [Loader](#) class objects. Classes derived from [Service](#) class must implement [process\(\)](#) method of [MCCInterface](#). It is up to developer how internal state of service is stored and communicated to other services and external utilities. [Service](#) is free to expect any type of payload passed to it and generate any payload as well. Useful types depend on MCCs in chain which leads to that service. For example if service is expected to be linked to SOAP [MCC](#) it must accept and generate messages with [PayloadSOAP](#) payload. Method [process\(\)](#) of class derived from [Service](#) class may be called concurrently in multiple threads. Developers must take that into account and write thread-safe implementation. Simple example of service is provided in /src/tests/echo/echo.cpp of source tree. The way to write client counterpart of corresponding service is undefined yet. For example see /src/tests/echo/test.cpp .

#### 5.43.2 Constructor & Destructor Documentation

##### 5.43.2.1 Arc::Service::Service ([Arc::Config](#) \*cfg \_\_attribute\_\_((unused))) [inline]

Example constructor - Server takes at least it's configuration subtree

### 5.43.3 Member Function Documentation

**5.43.3.1** `virtual void Arc::Service::AddSecHandler (Arc::Config * cfg, Arc::SecHandler * sechandler, const std::string & label = "")` [virtual]

SecHandler

### 5.43.4 Member Data Documentation

**5.43.4.1** `std::map<std::string,std::list<Arc::SecHandler*> >` [Arc::Service::sechandlers\\_](#)  
[protected]

Set of labeled authentication and authorization handlers. [MCC](#) calls sequence of handlers at specific point depending on associated identifier. in most aces those are "in" and "out" for incoming and outgoing messages correspondingly.

The documentation for this class was generated from the following file:

- Service.h

## 5.44 service\_descriptor Struct Reference

Identifier of Service plugin.

```
#include <ServiceLoader.h>
```

### Public Attributes

- const char \* **name**
- int **version**
- [Arc::Service](#) \*(\* **get\_instance**)([Arc::Config](#) \*cfg, [Arc::ChainContext](#) \*ctx)

### 5.44.1 Detailed Description

Identifier of Service plugin.

This structure describes one of the Services stored in a shared library. It contains name of plugin, version number and pointer to function which creates an instance of an object inherited from the Service class.

The documentation for this struct was generated from the following file:

- ServiceLoader.h

## 5.45 Arc::ServiceFactory Class Reference

[Service](#) Plugins handler.

```
#include <ServiceFactory.h>
```

Inheritance diagram for Arc::ServiceFactory::

### Public Member Functions

- [ServiceFactory](#) ([Config](#) \*cfg)
- [Service](#) \* [get\\_instance](#) (const std::string &name, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- [Service](#) \* [get\\_instance](#) (const std::string &name, int version, [Config](#) \*cfg, [ChainContext](#) \*ctx)
- [Service](#) \* [get\\_instance](#) (const std::string &name, int min\_version, int max\_version, [Config](#) \*cfg, [ChainContext](#) \*ctx)

### 5.45.1 Detailed Description

[Service](#) Plugins handler.

This class handles shared libraries containing Services

### 5.45.2 Constructor & Destructor Documentation

#### 5.45.2.1 Arc::ServiceFactory::ServiceFactory ([Config](#) \* cfg)

Constructor - accepts configuration (not yet used) meant to tune loading of module.

### 5.45.3 Member Function Documentation

#### 5.45.3.1 [Service](#)\* Arc::ServiceFactory::get\_instance (const std::string & name, [Config](#) \* cfg, [ChainContext](#) \* ctx)

These methods load shared library named lib'name', locate symbol representing descriptor of [Service](#) and calls it's constructor function. Supplied configuration tree is passed to constructor. Returns created [Service](#) instance.

Reimplemented from [Arc::LoaderFactory](#).

The documentation for this class was generated from the following file:

- ServiceFactory.h

## 5.46 Arc::SimpleCondition Class Reference

Simple triggered condition.

```
#include <Thread.h>
```

### Public Member Functions

- void [lock](#) (void)
- void [unlock](#) (void)
- void [signal](#) (void)
- void [signal\\_nonblock](#) (void)
- void [broadcast](#) (void)
- void [wait](#) (void)
- void [wait\\_nonblock](#) (void)
- void [wait](#) (int t)
- void [reset](#) (void)

### 5.46.1 Detailed Description

Simple triggered condition.

Provides condition and semaphor objects in one element.

### 5.46.2 Member Function Documentation

#### 5.46.2.1 void Arc::SimpleCondition::broadcast (void) [inline]

Signal about condition to all waiting threads

#### 5.46.2.2 void Arc::SimpleCondition::lock (void) [inline]

Acquire semaphor

#### 5.46.2.3 void Arc::SimpleCondition::reset (void) [inline]

Reset object to initial state

#### 5.46.2.4 void Arc::SimpleCondition::signal (void) [inline]

Signal about condition

#### 5.46.2.5 void Arc::SimpleCondition::signal\_nonblock (void) [inline]

Signal about condition without using semaphor

**5.46.2.6 void Arc::SimpleCondition::unlock (void) [inline]**

Release semaphor

**5.46.2.7 void Arc::SimpleCondition::wait (int *t*) [inline]**

Wait for condition no longer than *t* milliseconds

**5.46.2.8 void Arc::SimpleCondition::wait (void) [inline]**

Wait for condition

**5.46.2.9 void Arc::SimpleCondition::wait\_nonblock (void) [inline]**

Wait for condition without using semaphor

The documentation for this class was generated from the following file:

- Thread.h

## 5.47 Arc::SOAPEnvelope Class Reference

Extends [XMLNode](#) class to support structures of SOAP message.

```
#include <SOAPEnvelope.h>
```

Inheritance diagram for Arc::SOAPEnvelope::

### Public Member Functions

- [SOAPEnvelope](#) (const std::string &xml)
- [SOAPEnvelope](#) (const char \*xml, int len=-1)
- [SOAPEnvelope](#) (const NS &ns, bool fault=false)
- [SOAPEnvelope](#) ([XMLNode](#) doc)
- [SOAPEnvelope](#) \* [New](#) (void)
- void [Namespaces](#) (const NS &namespaces)
- void [GetXML](#) (std::string &xml) const
- [XMLNode Header](#) (void)
- bool [IsFault](#) (void)
- [SOAPFault](#) \* [Fault](#) (void)

### 5.47.1 Detailed Description

Extends [XMLNode](#) class to support structures of SOAP message.

All [XMLNode](#) methods are exposed by inheriting from [XMLNode](#) and node itself is translated into Envelope part of SOAP.

### 5.47.2 Constructor & Destructor Documentation

#### 5.47.2.1 Arc::SOAPEnvelope::SOAPEnvelope (const std::string & xml)

Create new SOAP message from textual representation of XML document. Created XML structure is owned by this instance. This constructor also sets default namespaces to default prefixes as specified below.

#### 5.47.2.2 Arc::SOAPEnvelope::SOAPEnvelope (const char \* xml, int len = -1)

Same as previous

#### 5.47.2.3 Arc::SOAPEnvelope::SOAPEnvelope (const NS & ns, bool fault = false)

Create new SOAP message with specified namespaces. Created XML structure is owned by this instance. If argument fault is set to true created message is fault.

#### 5.47.2.4 Arc::SOAPEnvelope::SOAPEnvelope (XMLNode doc)

Acquire XML document as SOAP message. Created XML structure is NOT owned by this instance.

### 5.47.3 Member Function Documentation

#### 5.47.3.1 SOAPFault\* Arc::SOAPEnvelope::Fault (void) [inline]

Get Fault part of message. Returns NULL if message is not Fault.

#### 5.47.3.2 void Arc::SOAPEnvelope::GetXML (std::string & xml) const

Fills argument with this instance XML (sub)tree textual representation

Reimplemented from [Arc::XMLNode](#).

#### 5.47.3.3 XMLNode Arc::SOAPEnvelope::Header (void) [inline]

Get SOAP header as XML node

#### 5.47.3.4 bool Arc::SOAPEnvelope::IsFault (void) [inline]

Returns true if message is Fault

#### 5.47.3.5 void Arc::SOAPEnvelope::Namespaces (const NS & namespaces)

Modify assigned namespaces. Default namespaces and prefixes are soap-enc <http://schemas.xmlsoap.org/soap/encoding/> soap-env <http://schemas.xmlsoap.org/soap/envelope/> xsi <http://www.w3.org/2001/XMLSchema-instance> xsd <http://www.w3.org/2001/XMLSchema>

Reimplemented from [Arc::XMLNode](#).

#### 5.47.3.6 SOAPEnvelope\* Arc::SOAPEnvelope::New (void)

Creates complete copy of SOAP. Do not use [New\(\)](#) method of [XMLNode](#) - use this one.

The documentation for this class was generated from the following file:

- SOAPEnvelope.h

## 5.48 Arc::SOAPFault Class Reference

Interface to SOAP Fault message.

```
#include <SOAPEnvelope.h>
```

### Public Types

- **undefined**
- **unknown**
- **VersionMismatch**
- **MustUnderstand**
- **Sender**
- **Receiver**
- **DataEncodingUnknown**
- enum [SOAPFaultCode](#) {  
    **undefined, unknown, VersionMismatch, MustUnderstand,**  
    **Sender, Receiver, DataEncodingUnknown }**

### Public Member Functions

- [SOAPFault](#) ([XMLNode](#) &body)
- [operator bool](#) (void)
- [SOAPFaultCode Code](#) (void)
- void [Code](#) ([SOAPFaultCode](#) code)
- std::string [Subcode](#) (int level)
- void [Subcode](#) (int level, const char \*subcode)
- std::string [Reason](#) (int num=0)
- void [Reason](#) (int num, const char \*reason)
- void [Reason](#) (const char \*reason)
- std::string [Node](#) (void)
- void [Node](#) (const char \*node)
- std::string [Role](#) (void)
- void [Role](#) (const char \*role)
- [XMLNode Detail](#) (bool create=false)

### Friends

- class [SOAPEnvelope](#)

#### 5.48.1 Detailed Description

Interface to SOAP Fault message.

[SOAPFault](#) class provides a convenience interface for accessing elements of SOAP faults. It also tries to expose single interface for both version 1.0 and 1.2 faults. This class is not intended to 'own' any information stored. It's purpose is to manipulate information which is kept under control of [XMLNode](#) or [SOAPEnvelope](#) classes. If instance does not refer to valid SOAP Fault structure all manipulation methods will have no effect.

## 5.48.2 Member Enumeration Documentation

### 5.48.2.1 enum Arc::SOAPFault::SOAPFaultCode

Fault codes of SOAP specs

## 5.48.3 Constructor & Destructor Documentation

### 5.48.3.1 Arc::SOAPFault::SOAPFault (XMLNode & body)

Parse Fault elements of SOAP Body or any other XML tree with Fault element

## 5.48.4 Member Function Documentation

### 5.48.4.1 void Arc::SOAPFault::Code (SOAPFaultCode code)

Set Fault Code element

### 5.48.4.2 SOAPFaultCode Arc::SOAPFault::Code (void)

Returns Fault Code element

### 5.48.4.3 XMLNode Arc::SOAPFault::Detail (bool create = false)

Access Fault Detail element. If create is set to true this element is created if not present.

### 5.48.4.4 void Arc::SOAPFault::Node (const char \* node)

Set content of Fault Node element to 'node'

### 5.48.4.5 std::string Arc::SOAPFault::Node (void)

Returns content of Fault Node element

### 5.48.4.6 Arc::SOAPFault::operator bool (void) [inline]

Returns true if instance refers to SOAP Fault

### 5.48.4.7 void Arc::SOAPFault::Reason (const char \* reason) [inline]

Set Fault Reason element at top level

### 5.48.4.8 void Arc::SOAPFault::Reason (int num, const char \* reason)

Set Fault Reason content at various levels to 'reason'

**5.48.4.9    `std::string Arc::SOAPFault::Reason (int num = 0)`**

Returns content of Fault Reason element at various levels

**5.48.4.10   `void Arc::SOAPFault::Role (const char * role)`**

Set content of Fault Role element to '*role*'

**5.48.4.11   `std::string Arc::SOAPFault::Role (void)`**

Returns content of Fault Role element

**5.48.4.12   `void Arc::SOAPFault::Subcode (int level, const char * subcode)`**

Set Fault Subcode element at various levels (0 is for Code) to '*subcode*'

**5.48.4.13   `std::string Arc::SOAPFault::Subcode (int level)`**

Returns Fault Subcode element at various levels (0 is for Code)

The documentation for this class was generated from the following file:

- SOAPEnvelope.h

## 5.49 Arc::SOAPMessage Class Reference

[Message](#) restricted to SOAP payload.

```
#include <SOAPMessage.h>
```

### Public Member Functions

- [SOAPMessage](#) (void)
- [SOAPMessage](#) (long msg\_ptr\_addr)
- [SOAPMessage](#) ([SOAPMessage](#) &msg)
- [SOAPMessage](#) ([Arc::Message](#) &msg)
- [~SOAPMessage](#) (void)
- [SOAPMessage](#) & operator= ([SOAPMessage](#) &msg)
- [Arc::PayloadSOAP](#) \* [Payload](#) (void)
- [Arc::PayloadSOAP](#) \* [Payload](#) ([Arc::PayloadSOAP](#) \*new\_payload)
- [Arc::MessageAttributes](#) \* [Attributes](#) (void)
- void [Attributes](#) ([Arc::MessageAttributes](#) \*attributes)
- [Arc::MessageAuth](#) \* [Auth](#) (void)
- void [Auth](#) ([Arc::MessageAuth](#) \*auth)
- [Arc::MessageContext](#) \* [Context](#) (void)
- void [Context](#) ([Arc::MessageContext](#) \*context)

### 5.49.1 Detailed Description

[Message](#) restricted to SOAP payload.

This is a special [Message](#) intended to be used in language bindings for programming languages which are not flexible enough to support all kinds of Payloads. It is passed through chain of MCCs and works like the [Message](#) but can carry only SOAP content.

### 5.49.2 Constructor & Destructor Documentation

#### 5.49.2.1 Arc::SOAPMessage::SOAPMessage (void) [inline]

Dummy constructor

#### 5.49.2.2 Arc::SOAPMessage::SOAPMessage (long msg\_ptr\_addr)

Copy constructor. Used by language bindings

#### 5.49.2.3 Arc::SOAPMessage::SOAPMessage ([SOAPMessage](#) & msg) [inline]

Copy constructor. Ensures shallow copy.

#### 5.49.2.4 Arc::SOAPMessage::SOAPMessage ([Arc::Message](#) & msg)

Copy constructor. Ensures shallow copy.

**5.49.2.5** `Arc::SOAPMessage::~~SOAPMessage (void)` `[inline]`

Destructor does not affect refered objects

**5.49.3 Member Function Documentation****5.49.3.1** `Arc::MessageAttributes* Arc::SOAPMessage::Attributes (void)` `[inline]`

Returns a pointer to the current attributes object or NULL if no attributes object has been assigned.

**5.49.3.2** `SOAPMessage& Arc::SOAPMessage::operator= (SOAPMessage & msg)` `[inline]`

Assignment. Ensures shallow copy.

**5.49.3.3** `Arc::PayloadSOAP* Arc::SOAPMessage::Payload (Arc::PayloadSOAP * new_payload)`  
`[inline]`

Replace payload with new one

**5.49.3.4** `Arc::PayloadSOAP* Arc::SOAPMessage::Payload (void)` `[inline]`

Returns pointer to current payload or NULL if no payload assigned.

The documentation for this class was generated from the following file:

- SOAPMessage.h

## 5.50 Arc::Time Class Reference

A class for storing and manipulating times.

```
#include <DateTime.h>
```

### Public Member Functions

- [Time](#) ()
- [Time](#) (const time\_t &)
- [Time](#) (const std::string &)
- [Time](#) & [operator=](#) (const time\_t &)
- void [SetTime](#) (const time\_t &)
- time\_t [GetTime](#) () const
- [operator std::string](#) () const
- std::string [str](#) (const [TimeFormat](#) &=time\_format) const
- bool [operator<](#) (const [Time](#) &) const
- bool [operator>](#) (const [Time](#) &) const
- bool [operator<=](#) (const [Time](#) &) const
- bool [operator>=](#) (const [Time](#) &) const
- bool [operator==](#) (const [Time](#) &) const
- bool [operator!=](#) (const [Time](#) &) const

### Static Public Member Functions

- static void [SetFormat](#) (const [TimeFormat](#) &)
- static [TimeFormat](#) [GetFormat](#) ()

#### 5.50.1 Detailed Description

A class for storing and manipulating times.

#### 5.50.2 Constructor & Destructor Documentation

##### 5.50.2.1 Arc::Time::Time ()

Default constructor. The time is put equal the current time.

##### 5.50.2.2 Arc::Time::Time (const time\_t &)

Constructor that takes a time\_t variable and stores it.

##### 5.50.2.3 Arc::Time::Time (const std::string &)

Constructor that tries to convert a string into a time\_t.

### 5.50.3 Member Function Documentation

#### 5.50.3.1 static [TimeFormat](#) Arc::Time::GetFormat () [static]

Gets the default format for time strings.

#### 5.50.3.2 time\_t Arc::Time::GetTime () const

gets the time

#### 5.50.3.3 Arc::Time::operator std::string () const

Returns a string representation of the time, using the default format.

#### 5.50.3.4 bool Arc::Time::operator!= (const [Time](#) &) const

Comparing two [Time](#) objects.

#### 5.50.3.5 bool Arc::Time::operator< (const [Time](#) &) const

Comparing two [Time](#) objects.

#### 5.50.3.6 bool Arc::Time::operator<= (const [Time](#) &) const

Comparing two [Time](#) objects.

#### 5.50.3.7 [Time&](#) Arc::Time::operator= (const time\_t &)

Assignment operator from a time\_t.

#### 5.50.3.8 bool Arc::Time::operator== (const [Time](#) &) const

Comparing two [Time](#) objects.

#### 5.50.3.9 bool Arc::Time::operator> (const [Time](#) &) const

Comparing two [Time](#) objects.

#### 5.50.3.10 bool Arc::Time::operator>= (const [Time](#) &) const

Comparing two [Time](#) objects.

#### 5.50.3.11 static void Arc::Time::SetFormat (const [TimeFormat](#) &) [static]

Sets the default format for time strings.

**5.50.3.12 void Arc::Time::SetTime (const time\_t &)**

sets the time

**5.50.3.13 std::string Arc::Time::str (const TimeFormat & = time\_format) const**

Returns a string representation of the time, using the specified format.

The documentation for this class was generated from the following file:

- DateTime.h

## 5.51 Arc::URL Class Reference

Class to hold general URL's.

```
#include <URL.h>
```

Inheritance diagram for Arc::URL::

### Public Member Functions

- [URL](#) ()
- [URL](#) (const std::string &url)
- virtual [~URL](#) ()
- const std::string & [Protocol](#) () const
- const std::string & [Username](#) () const

- const std::list< [URLLocation](#) > & [Locations](#) () const
- const std::map< std::string, std::string > & [CommonLocOptions](#) () const
- const std::string & [CommonLocOption](#) (const std::string &option, const std::string &undefined="") const
- virtual std::string [str](#) () const
- virtual std::string [CanonicalURL](#) () const
- virtual std::string [ConnectionURL](#) () const
- bool [operator<](#) (const [URL](#) &url) const
- bool [operator==](#) (const [URL](#) &url) const
- [operator bool](#) () const
- bool [operator!](#) () const

### Static Protected Member Functions

- static std::string [BaseDN2Path](#) (const std::string &)
- static std::string [Path2BaseDN](#) (const std::string &)

## Protected Attributes

- std::string [protocol](#)
- std::string [username](#)
- std::string [passwd](#)
- std::string [host](#)
- int [port](#)
- std::string [path](#)
- std::map< std::string, std::string > [httpoptions](#)
- std::map< std::string, std::string > [urloptions](#)
- std::list< [URLLocation](#) > [locations](#)
- std::map< std::string, std::string > [commonlocoptions](#)

## Friends

- std::ostream & [operator<<](#) (std::ostream &out, const [URL](#) &u)

### 5.51.1 Detailed Description

Class to hold general URL's.

A [URL](#) is constructed from a string representation and split into protocol, hostname, port and path.

### 5.51.2 Constructor & Destructor Documentation

#### 5.51.2.1 Arc::URL::URL ()

Empty constructor. Necessary when the class is part of another class and the like.

#### 5.51.2.2 Arc::URL::URL (const std::string & url)

Constructs a new [URL](#) from a string representation. The string is split into protocol, hostname, port and path.

#### 5.51.2.3 virtual Arc::URL::~~URL () [virtual]

[URL](#) Destructor

### 5.51.3 Member Function Documentation

#### 5.51.3.1 void Arc::URL::AddOption (const std::string & option, const std::string & value, bool overwrite = true)

Adds a [URL](#) option.

#### 5.51.3.2 std::string Arc::URL::BaseDN () const

In case of ldap-protocol, return the basedn of the [URL](#).

**5.51.3.3 static std::string Arc::URL::BaseDN2Path (const std::string &) [static, protected]**

a private method that converts an ldap basedn to a path.

**5.51.3.4 virtual std::string Arc::URL::CanonicalURL () const [virtual]**

Returns the [URL](#) string representation w/o options and locations

**5.51.3.5 const std::string& Arc::URL::CommonLocOption (const std::string & *option*, const std::string & *undefined* = "") const**

Returns the value of the common location option

**Parameters:**

*option*. Returns

*undefined* if the common location option is not defined.

**5.51.3.6 const std::map<std::string, std::string>& Arc::URL::CommonLocOptions () const**

Returns the common location options if any.

**5.51.3.7 virtual std::string Arc::URL::ConnectionURL () const [virtual]**

Returns a string representation with protocol, host and port only

**5.51.3.8 const std::string& Arc::URL::Host () const**

Returns the hostname of the [URL](#).

**5.51.3.9 const std::string& Arc::URL::HTTPOption (const std::string & *option*, const std::string & *undefined* = "") const**

Returns the value of the HTTP option

**Parameters:**

*option*. Returns

*undefined* if the HTTP option is not defined.

**5.51.3.10 const std::map<std::string, std::string>& Arc::URL::HTTPOptions () const**

Returns HTTP options if any.

**5.51.3.11 const std::list<[URLLocation](#)>& Arc::URL::Locations () const**

Returns the locations if any.

**5.51.3.12 Arc::URL::operator bool () const**

Check if instance holds valid [URL](#)

**5.51.3.13 bool Arc::URL::operator< (const [URL](#) & url) const**

Compares one [URL](#) to another

**5.51.3.14 bool Arc::URL::operator== (const [URL](#) & url) const**

Is one [URL](#) equal to another?

**5.51.3.15 const std::string& Arc::URL::Option (const std::string & option, const std::string & undefined = "") const**

Returns the value of the [URL](#) option

**Parameters:**

*option*. Returns

*undefined* if the [URL](#) option is not defined.

**5.51.3.16 const std::map<std::string, std::string>& Arc::URL::Options () const**

Returns [URL](#) options if any.

**5.51.3.17 const std::string& Arc::URL::Passwd () const**

Returns the password of the [URL](#).

**5.51.3.18 const std::string& Arc::URL::Path () const**

Returns the path of the [URL](#).

**5.51.3.19 static std::string Arc::URL::Path2BaseDN (const std::string &) [static, protected]**

a private method that converts an ldap path to a basedn.

**5.51.3.20 int Arc::URL::Port () const**

Returns the port of the [URL](#).

**5.51.3.21 const std::string& Arc::URL::Protocol () const**

Returns the protocol of the [URL](#).

**5.51.3.22 virtual std::string Arc::URL::str () const** [virtual]

Returns a string representation of the [URL](#).

Reimplemented in [Arc::URLLocation](#).

**5.51.3.23 const std::string& Arc::URL::Username () const**

Returns the username of the [URL](#).

**5.51.4 Friends And Related Function Documentation****5.51.4.1 std::ostream& operator<< (std::ostream & out, const URL & u)** [friend]

Overloaded operator << to print a [URL](#).

**5.51.5 Member Data Documentation****5.51.5.1 std::map<std::string, std::string> Arc::URL::commonlocoptions** [protected]

common location options for index server URLs.

**5.51.5.2 std::string Arc::URL::host** [protected]

hostname of the url.

**5.51.5.3 std::map<std::string, std::string> Arc::URL::httpoptions** [protected]

http-options of the url.

**5.51.5.4 std::list<URLLocation> Arc::URL::locations** [protected]

locations for index server URLs.

**5.51.5.5 std::string Arc::URL::passwd** [protected]

password of the url.

**5.51.5.6 std::string Arc::URL::path** [protected]

the url path.

**5.51.5.7 int Arc::URL::port** [protected]

portnumber of the url.

**5.51.5.8** `std::string Arc::URL::protocol` [protected]

the url protocol.

**5.51.5.9** `std::map<std::string, std::string> Arc::URL::urloptions` [protected]

options of the url.

**5.51.5.10** `std::string Arc::URL::username` [protected]

username of the url.

The documentation for this class was generated from the following file:

- URL.h

## 5.52 Arc::URLLocation Class Reference

Class to hold a resolved [URL](#) location.

```
#include <URL.h>
```

Inheritance diagram for Arc::URLLocation::

### Public Member Functions

- [URLLocation](#) (const std::string &url)
- [URLLocation](#) (const std::string &name, const std::string &optstring)
- virtual [~URLLocation](#) ()
- std::string [Name](#) () const
- virtual std::string [str](#) () const

### Protected Attributes

- std::string [name](#)

#### 5.52.1 Detailed Description

Class to hold a resolved [URL](#) location.

It is specific for an RC or RLS registration.

#### 5.52.2 Constructor & Destructor Documentation

##### 5.52.2.1 Arc::URLLocation::URLLocation (const std::string & url)

Creates a [URL](#) Location from a [URL](#).

##### 5.52.2.2 Arc::URLLocation::URLLocation (const std::string & name, const std::string & optstring)

Creates a [URL](#) Location from a name and an option string.

##### 5.52.2.3 virtual Arc::URLLocation::~~URLLocation () [virtual]

[URL](#) Location destructor.

### 5.52.3 Member Function Documentation

#### 5.52.3.1 `std::string Arc::URLLocation::Name () const`

Returns the [URL](#) Location name (used for RC registrations).

#### 5.52.3.2 `virtual std::string Arc::URLLocation::str () const` [virtual]

Returns a string representation of the [URL](#) Location.

Reimplemented from [Arc::URL](#).

### 5.52.4 Member Data Documentation

#### 5.52.4.1 `std::string Arc::URLLocation::name` [protected]

the [URL](#) Location name (used for RC registrations).

The documentation for this class was generated from the following file:

- [URL.h](#)

## 5.53 Arc::WSAEndpointReference Class Reference

Interface for manipulation of WS-Addressing Endpoint Reference.

```
#include <WSA.h>
```

### Public Member Functions

- [WSAEndpointReference](#) ([XMLNode](#) epr)
- [WSAEndpointReference](#) (const std::string &address)
- [WSAEndpointReference](#) (void)
- [~WSAEndpointReference](#) (void)
- std::string [Address](#) (void) const
- void [Address](#) (const std::string &uri)
- [WSAEndpointReference](#) & [operator=](#) (const std::string &address)
- [XMLNode](#) [ReferenceParameters](#) (void)
- [XMLNode](#) [MetaData](#) (void)
- [operator XMLNode](#) (void)

### Protected Attributes

- [XMLNode](#) epr\_

#### 5.53.1 Detailed Description

Interface for manipulation of WS-Addressing Endpoint Reference.

It works on Endpoint Reference stored in XML tree. No information is stored in this object except reference to corresponding XML subtree.

#### 5.53.2 Constructor & Destructor Documentation

##### 5.53.2.1 Arc::WSAEndpointReference::WSAEndpointReference ([XMLNode](#) epr)

Linking to existing EPR in XML tree

##### 5.53.2.2 Arc::WSAEndpointReference::WSAEndpointReference (const std::string & address)

Creating independent EPR - not implemented

##### 5.53.2.3 Arc::WSAEndpointReference::WSAEndpointReference (void)

Dummy constructor - creates invalid instance

##### 5.53.2.4 Arc::WSAEndpointReference::~~WSAEndpointReference (void)

Destructor. All empty elements of EPR XML are destroyed here too

### 5.53.3 Member Function Documentation

#### 5.53.3.1 void Arc::WSAEndpointReference::Address (const std::string & *uri*)

Assigns new Address value. If EPR had no Address element it is created.

#### 5.53.3.2 std::string Arc::WSAEndpointReference::Address (void) const

Returns Address ([URL](#)) encoded in EPR

#### 5.53.3.3 [XMLNode](#) Arc::WSAEndpointReference::MetaData (void)

Access to MetaData element of EPR. Obtained XML element should be manipulated directly in application-dependent way. If EPR had no MetaData element it is created.

#### 5.53.3.4 Arc::WSAEndpointReference::operator [XMLNode](#) (void)

Returns reference to EPR top XML node

#### 5.53.3.5 [WSAEndpointReference&](#) Arc::WSAEndpointReference::operator= (const std::string & *address*)

Same as Address(uri)

#### 5.53.3.6 [XMLNode](#) Arc::WSAEndpointReference::ReferenceParameters (void)

Access to ReferenceParameters element of EPR. Obtained XML element should be manipulated directly in application-dependent way. If EPR had no ReferenceParameters element it is created.

The documentation for this class was generated from the following file:

- WSA.h

## 5.54 Arc::WSAHeader Class Reference

Interface for manipulation WS-Addressing information in SOAP header.

```
#include <WSA.h>
```

### Public Member Functions

- [WSAHeader](#) ([SOAPEnvelope](#) &soap)
- [WSAHeader](#) (const std::string &action)
- std::string [To](#) (void) const
- void [To](#) (const std::string &uri)
- [WSAEndpointReference From](#) (void)
- [WSAEndpointReference ReplyTo](#) (void)
- [WSAEndpointReference FaultTo](#) (void)
- std::string [Action](#) (void) const
- void [Action](#) (const std::string &uri)
- std::string [MessageID](#) (void) const
- void [MessageID](#) (const std::string &uri)
- std::string [RelatesTo](#) (void) const
- void [RelatesTo](#) (const std::string &uri)
- std::string [RelationshipType](#) (void) const
- void [RelationshipType](#) (const std::string &uri)
- [XMLNode ReferenceParameter](#) (int n)
- [XMLNode ReferenceParameter](#) (const std::string &name)
- [XMLNode NewReferenceParameter](#) (const std::string &name)
- [operator XMLNode](#) (void)

### Static Public Member Functions

- static bool [Check](#) ([SOAPEnvelope](#) &soap)

### Protected Attributes

- [XMLNode header\\_](#)
- bool [header\\_allocated\\_](#)

#### 5.54.1 Detailed Description

Interface for manipulation WS-Addressing information in SOAP header.

It works on Endpoint Reference stored in XML tree. No information is stored in this object except reference to corresponding XML subtree.

#### 5.54.2 Constructor & Destructor Documentation

##### 5.54.2.1 Arc::WSAHeader::WSAHeader ([SOAPEnvelope](#) & soap)

Linking to a header of existing SOAP message

### 5.54.2.2 Arc::WSAHeader::WSAHeader (const std::string & action)

Creating independent SOAP header - not implemented

## 5.54.3 Member Function Documentation

### 5.54.3.1 void Arc::WSAHeader::Action (const std::string & uri)

Set content of Action element of SOAP Header. If such element does not exist it's created.

### 5.54.3.2 std::string Arc::WSAHeader::Action (void) const

Returns content of Action element of SOAP Header.

### 5.54.3.3 static bool Arc::WSAHeader::Check (SOAPEnvelope & soap) [static]

Tells if specified SOAP message has WSA header

### 5.54.3.4 WSAEndpointReference Arc::WSAHeader::FaultTo (void)

Returns FaultTo element of SOAP Header. If such element does not exist it's created. Obtained element may be manipulated.

### 5.54.3.5 WSAEndpointReference Arc::WSAHeader::From (void)

Returns From element of SOAP Header. If such element does not exist it's created. Obtained element may be manipulated.

### 5.54.3.6 void Arc::WSAHeader::MessageID (const std::string & uri)

Set content of MessageID element of SOAP Header. If such element does not exist it's created.

### 5.54.3.7 std::string Arc::WSAHeader::MessageID (void) const

Returns content of MessageID element of SOAP Header.

### 5.54.3.8 XMLNode Arc::WSAHeader::NewReferenceParameter (const std::string & name)

Creates new ReferenceParameter element with specified name. Returns reference to created element.

### 5.54.3.9 Arc::WSAHeader::operator XMLNode (void)

Returns reference to SOAP Header - not implemented

### 5.54.3.10 XMLNode Arc::WSAHeader::ReferenceParameter (const std::string & name)

Returns first ReferenceParameter element with specified name

**5.54.3.11 XMLNode Arc::WSAHeader::ReferenceParameter (int *n*)**

Return n-th ReferenceParameter element

**5.54.3.12 void Arc::WSAHeader::RelatesTo (const std::string & *uri*)**

Set content of RelatesTo element of SOAP Header. If such element does not exist it's created.

**5.54.3.13 std::string Arc::WSAHeader::RelatesTo (void) const**

Returns content of RelatesTo element of SOAP Header.

**5.54.3.14 void Arc::WSAHeader::RelationshipType (const std::string & *uri*)**

Set content of RelationshipType element of SOAP Header. If such element does not exist it's created.

**5.54.3.15 std::string Arc::WSAHeader::RelationshipType (void) const**

Returns content of RelationshipType element of SOAP Header.

**5.54.3.16 WSAEndpointReference Arc::WSAHeader::ReplyTo (void)**

Returns ReplyTo element of SOAP Header. If such element does not exist it's created. Obtained element may be manipulated.

**5.54.3.17 void Arc::WSAHeader::To (const std::string & *uri*)**

Set content of To element of SOAP Header. If such element does not exist it's created.

**5.54.3.18 std::string Arc::WSAHeader::To (void) const**

Returns content of To element of SOAP Header.

**5.54.4 Member Data Documentation****5.54.4.1 bool Arc::WSAHeader::header\_allocated\_ [protected]**

SOAP header element

The documentation for this class was generated from the following file:

- WSA.h

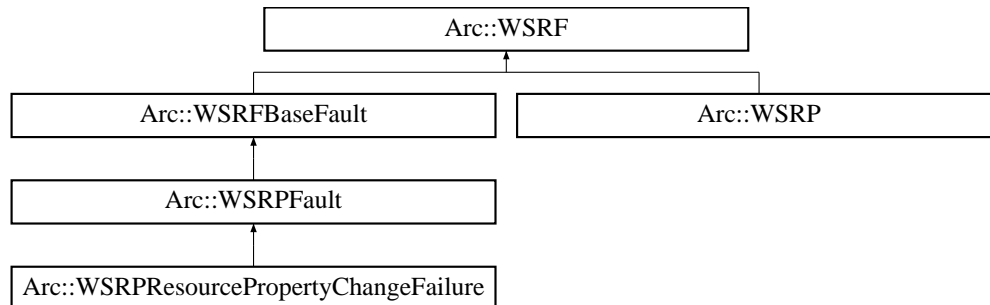

## 5.55 Arc::WSRF Class Reference

Base class for every [WSRF](#) message.

```
#include <WSRF.h>
```

Inheritance diagram for Arc::WSRF::

### Public Member Functions

- [WSRF](#) ([SOAPEnvelope](#) &soap, const std::string &action="")
- [WSRF](#) (bool fault=false, const std::string &action="")
- virtual [SOAPEnvelope](#) & [SOAP](#) (void)
- virtual [operator bool](#) (void)
- virtual bool **operator!** (void)

### Protected Member Functions

- void [set\\_namespaces](#) (void)

### Protected Attributes

- [SOAPEnvelope](#) & soap\_
- bool [allocated\\_](#)
- bool [valid\\_](#)

#### 5.55.1 Detailed Description

Base class for every [WSRF](#) message.

This class is not intended to be used directly. Use it like reference while passing through unknown [WSRF](#) message or use classes derived from it.

#### 5.55.2 Constructor & Destructor Documentation

##### 5.55.2.1 Arc::WSRF::WSRF ([SOAPEnvelope](#) & soap, const std::string & action = "")

Constructor - creates object out of supplied SOAP tree.

### 5.55.2.2 `Arc::WSRF::WSRF (bool fault = false, const std::string & action = "")`

Constructor - creates new [WSRF](#) object

## 5.55.3 Member Function Documentation

### 5.55.3.1 `virtual Arc::WSRF::operator bool (void)` [inline, virtual]

Returns true if instance is valid

### 5.55.3.2 `void Arc::WSRF::set_namespaces (void)` [protected]

set WS Resource namespaces and default prefixes in SOAP message

Reimplemented in [Arc::WSRP](#), and [Arc::WSRFBBaseFault](#).

### 5.55.3.3 `virtual SOAPEnvelope& Arc::WSRF::SOAP (void)` [inline, virtual]

Direct access to underlying SOAP element

## 5.55.4 Member Data Documentation

### 5.55.4.1 `bool Arc::WSRF::allocated_` [protected]

Associated SOAP message - it's SOAP message after all

### 5.55.4.2 `bool Arc::WSRF::valid_` [protected]

true if soap\_ needs to be deleted in destructor

The documentation for this class was generated from the following file:

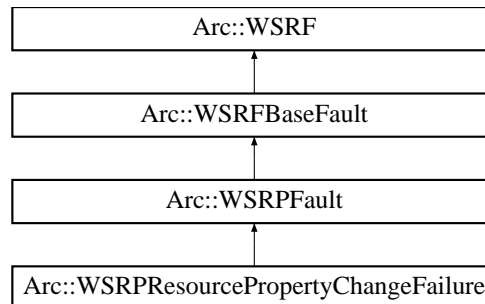

- [WSRF.h](#)

## 5.56 Arc::WSRFBaseFault Class Reference

Base class for [WSRF](#) fault messages.

```
#include <WSRFBaseFault.h>
```

Inheritance diagram for Arc::WSRFBaseFault::

### Public Member Functions

- [WSRFBaseFault](#) ([SOAPEnvelope](#) &soap)
- [WSRFBaseFault](#) (const std::string &type)
- std::string **Type** (void)
- [Time](#) **Timestamp** (void)
- void **Timestamp** ([Time](#))
- [WSAEndpointReference](#) **Originator** (void)
- void **ErrorCode** (const std::string &dialect, const [XMLNode](#) &error)
- [XMLNode](#) **ErrorCode** (void)
- std::string **ErrorCodeDialect** (void)
- void **Description** (int pos, const std::string &desc, const std::string &lang)
- std::string **Description** (int pos)
- std::string **DescriptionLang** (int pos)
- void **FaultCause** (int pos, const [XMLNode](#) &cause)
- [XMLNode](#) **FaultCause** (int pos)

### Protected Member Functions

- void [set\\_namespaces](#) (void)

#### 5.56.1 Detailed Description

Base class for [WSRF](#) fault messages.

Use classes inherited from it for specific faults.

#### 5.56.2 Constructor & Destructor Documentation

##### 5.56.2.1 Arc::WSRFBaseFault::WSRFBaseFault ([SOAPEnvelope](#) & soap)

Constructor - creates object out of supplied SOAP tree.

### 5.56.2.2 Arc::WSRFBaseFault::WSRFBaseFault (const std::string & *type*)

Constructor - creates new [WSRF](#) fault

## 5.56.3 Member Function Documentation

### 5.56.3.1 void Arc::WSRFBaseFault::set\_namespaces (void) [protected]

set WS-ResourceProperties namespaces and default prefixes in SOAP message

Reimplemented from [Arc::WSRF](#).

The documentation for this class was generated from the following file:

- WSRFBaseFault.h

## 5.57 Arc::WSRP Class Reference

Base class for WS-ResourceProperties structures.

```
#include <WSResourceProperties.h>
```

Inheritance diagram for Arc::WSRP::

### Public Member Functions

- [WSRP](#) (bool fault=false, const std::string &action="")
- [WSRP](#) ([SOAPEnvelope](#) &soap, const std::string &action="")

### Protected Member Functions

- void [set\\_namespaces](#) (void)

#### 5.57.1 Detailed Description

Base class for WS-ResourceProperties structures.

Inheriting classes implement specific WS-ResourceProperties messages and their properties/elements. Refer to WS-ResourceProperties specifications for things specific to every message.

#### 5.57.2 Constructor & Destructor Documentation

##### 5.57.2.1 Arc::WSRP::WSRP (bool fault = false, const std::string & action = "")

Constructor - prepares object for creation of new [WSRP](#) request/response/fault

##### 5.57.2.2 Arc::WSRP::WSRP ([SOAPEnvelope](#) & soap, const std::string & action = "")

Constructor - creates object out of supplied SOAP tree. It does not check if 'soap' represents valid WS-ResourceProperties structure. Actual check for validity of structure has to be done by derived class.

#### 5.57.3 Member Function Documentation

##### 5.57.3.1 void Arc::WSRP::set\_namespaces (void) [protected]

set WS-ResourceProperties namespaces and default prefixes in SOAP message

Reimplemented from [Arc::WSRF](#).

The documentation for this class was generated from the following file:

- [WSResourceProperties.h](#)

## 5.58 Arc::WSRPFault Class Reference

Base class for WS-ResourceProperties faults.

```
#include <WSResourceProperties.h>
```

Inheritance diagram for Arc::WSRPFault::

### Public Member Functions

- [WSRPFault](#) ([SOAPEnvelope](#) &soap)
- [WSRPFault](#) (const std::string &type)

### 5.58.1 Detailed Description

Base class for WS-ResourceProperties faults.

### 5.58.2 Constructor & Destructor Documentation

#### 5.58.2.1 Arc::WSRPFault::WSRPFault ([SOAPEnvelope](#) & soap)

Constructor - creates object out of supplied SOAP tree.

#### 5.58.2.2 Arc::WSRPFault::WSRPFault (const std::string & type)

Constructor - creates new [WSRP](#) fault

The documentation for this class was generated from the following file:

- WSResourceProperties.h

## 5.59 Arc::WSRPResourcePropertyChangeFailure Class Reference

```
#include <WSResourceProperties.h>
```

Inheritance diagram for Arc::WSRPResourcePropertyChangeFailure::

### Public Member Functions

- [WSRPResourcePropertyChangeFailure](#) ([SOAPEnvelope](#) &soap)
- [WSRPResourcePropertyChangeFailure](#) (const std::string &type)
- [XMLNode](#) [CurrentProperties](#) (bool create=false)
- [XMLNode](#) [RequestedProperties](#) (bool create=false)

### 5.59.1 Detailed Description

Base class for WS-ResourceProperties faults which contain ResourcePropertyChangeFailure

### 5.59.2 Constructor & Destructor Documentation

#### 5.59.2.1 Arc::WSRPResourcePropertyChangeFailure::WSRPResourcePropertyChangeFailure ([SOAPEnvelope](#) & soap) [inline]

Constructor - creates object out of supplied SOAP tree.

#### 5.59.2.2 Arc::WSRPResourcePropertyChangeFailure::WSRPResourcePropertyChangeFailure (const std::string & type) [inline]

Constructor - creates new [WSRP](#) fault

The documentation for this class was generated from the following file:

- WSResourceProperties.h

## 5.60 Arc::XMLNode Class Reference

Wrapper for LibXML library Tree interface.

```
#include <XMLNode.h>
```

Inheritance diagram for Arc::XMLNode::

### Public Member Functions

- [XMLNode](#) (void)

- bool **MatchXMLName** (const [XMLNode](#) &node, const char \*name)

### 5.60.1 Detailed Description

Wrapper for LibXML library Tree interface.

This class wraps XML Node, Document and Property/Attribute structures. Each instance serves as pointer to actual LibXML element and provides convenient (for chosen purpose) methods for manipulating it. This class has no special ties to LibXML library and may be easily rewritten for any XML parser which provides interface similar to LibXML Tree. It implements only small subset of XML capabilities, which is probably enough for performing most of useful actions. This class also filters out (usually) useless textual nodes which are often used to make XML documents human-readable.

### 5.60.2 Constructor & Destructor Documentation

#### 5.60.2.1 Arc::XMLNode::XMLNode (xmlNodePtr *node*) [inline, protected]

Private constructor for inherited classes Creates instance and links to existing LibXML structure. Acquired structure is not owned by class instance. If there is need to completely pass control of LibXML document to then instance's `is_owner_` variable has to be set to true.

#### 5.60.2.2 Arc::XMLNode::XMLNode (void) [inline]

Constructor of invalid node Created instance does not point to XML element. All methods are still allowed for such instance but produce no results.

#### 5.60.2.3 Arc::XMLNode::XMLNode (const [XMLNode](#) & *node*) [inline]

Copies existing instance. Underlying XML element is NOT copied. Ownership is NOT inherited.

**5.60.2.4 Arc::XMLNode::XMLNode (const std::string & *xml*) [inline]**

Creates XML document structure from textual representation of XML document. Created structure is pointed and owned by constructed instance

**5.60.2.5 Arc::XMLNode::XMLNode (const char \* *xml*, int *len* = -1) [inline]**

Same as previous

**5.60.2.6 Arc::XMLNode::XMLNode (const Arc::NS & *ns*) [inline]**

Creates empty XML document structure with specified namespaces. Created structure is pointed and owned by constructed instance

**5.60.2.7 Arc::XMLNode::~~XMLNode (void) [inline]**

Destructor Also destroys underlying XML document if owned by this instance

**5.60.3 Member Function Documentation****5.60.3.1 XMLNode Arc::XMLNode::Attribute (const std::string & *name*)**

Returns XMLNode instance representing first attribute of node with specified by name

**5.60.3.2 XMLNode Arc::XMLNode::Attribute (int *n* = 0)**

Returns XMLNode instance representing n-th attribute of node.

**5.60.3.3 int Arc::XMLNode::AttributesSize (void)**

Returns number of attributes of node

**5.60.3.4 XMLNode Arc::XMLNode::Child (int *n* = 0) const [inline]**

Returns XMLNode instance representing n-th child of XML element. If such does not exist invalid XMLNode instance is returned

**5.60.3.5 void Arc::XMLNode::Destroy (void)**

Destroys underlying XML element. XML element is unlinked from XML tree and destroyed. After this operation XMLNode instance becomes invalid

**5.60.3.6 void Arc::XMLNode::GetXML (std::string & *xml*) const [inline]**

Fills argument with this instance XML (sub)tree textual representation

Reimplemented in Arc::SOAPEnvelope.

**5.60.3.7 void Arc::XMLNode::Name (const std::string & name)**

Assign new name to XML node

**5.60.3.8 std::string Arc::XMLNode::Name (void) const [inline]**

Returns name of XML node

**5.60.3.9 std::string Arc::XMLNode::NamespacePrefix (const char \* urn)**

Returns prefix of specified namespace. Empty string if no such namespace.

**5.60.3.10 void Arc::XMLNode::Namespaces (const Arc::NS & namespaces)**

Assign namespaces of XML document at point specified by this instance. If namespace already exists it gets new prefix. New namespaces are added. It is usefull to apply this method to XML being processed in order to refer to it's elements by known prefix.

Reimplemented in [Arc::SOAPEnvelope](#).

**5.60.3.11 void Arc::XMLNode::New (XMLNode & new\_node)**

Creates a copy of XML (sub)tree. If object does not represent whole document - top level document is created. 'new\_node' becomes a pointer owning new XML document.

**5.60.3.12 XMLNode Arc::XMLNode::NewAttribute (const char \* name)**

Same as previous method

**5.60.3.13 XMLNode Arc::XMLNode::NewAttribute (const std::string & name)**

Creates new attribute with specified name.

**5.60.3.14 XMLNode Arc::XMLNode::NewChild (const XMLNode & node, int n = -1, bool global\_order = false)**

Link a copy of supplied XML node as child. Returns instance refering to new child. XML element is a copy on supplied one but not owned by returned instance

**5.60.3.15 XMLNode Arc::XMLNode::NewChild (const char \* name, int n = -1, bool global\_order = false)**

Same as previous method

### 5.60.3.16 [XMLNode](#) Arc::XMLNode::NewChild (const std::string & *name*, int *n* = -1, bool *global\_order* = false) [inline]

Creates new child XML element at specified position with specified name. Default is to put it at end of list. If global order is true position applies to whole set of children, otherwise only to children of same name

### 5.60.3.17 Arc::XMLNode::operator bool (void) const [inline]

Returns true if instance points to XML element - valid instance

### 5.60.3.18 Arc::XMLNode::operator std::string (void) const [inline]

Returns textual content of node excluding content of children nodes

### 5.60.3.19 bool Arc::XMLNode::operator! (void) const [inline]

Returns true if instance does not point to XML element - invalid instance

### 5.60.3.20 [XMLNode&](#) Arc::XMLNode::operator= (const [XMLNode](#) & *node*) [inline]

Make instance refer to another XML node. Ownership is not inherited.

### 5.60.3.21 [XMLNode&](#) Arc::XMLNode::operator= (const char \* *content*) [inline]

Same as previous method

### 5.60.3.22 [XMLNode&](#) Arc::XMLNode::operator= (const std::string & *content*) [inline]

Sets textual content of node. All existing children nodes are discarded.

### 5.60.3.23 ]

[XMLNode](#) Arc::XMLNode::operator[] (int *n*) const

Returns [XMLNode](#) instance representing n-th node in sequence of siblings of same name. It's main purpose is to be used to retrieve element in array of children of same name like node["name"][5]

### 5.60.3.24 ]

[XMLNode](#) Arc::XMLNode::operator[] (const std::string & *name*) const [inline]

Similar to previous method

### 5.60.3.25 ]

[XMLNode](#) Arc::XMLNode::operator[] (const char \* *name*) const

Returns [XMLNode](#) instance representing first child element with specified name. Name may be "namespace\_prefix:name" or simply "name". In last case namespace is ignored. If such node does not exist invalid [XMLNode](#) instance is returned

#### 5.60.3.26 `int Arc::XMLNode::Size (void) const` [inline]

Returns number of children nodes

#### 5.60.3.27 `std::list<XMLNode> Arc::XMLNode::XPathLookup (const std::string & xpathExpr, const Arc::NS & nsList)`

Uses xPath to look up the whole xml structure, Returns a list of [XMLNode](#) points. The xpathExpr should be like "//xx:child1/" which indicates the namespace and node that you would like to find; The nsList is the namespace the result should belong to (e.g. xx="uri:test").

### 5.60.4 Friends And Related Function Documentation

#### 5.60.4.1 `bool MatchXMLName (const XMLNode & node, const char * name)` [friend]

Returns true if 'name' matches name of 'node'. If name contains prefix it's checked too

#### 5.60.4.2 `bool MatchXMLName (const XMLNode & node1, const XMLNode & node2)` [friend]

Returns true if underlying XML elements have same names

### 5.60.5 Member Data Documentation

#### 5.60.5.1 `bool Arc::XMLNode::is\_owner\_` [protected]

If true node is owned by this instance - hence released in destructor. Normally that may be true only for top level node of XML document.

#### 5.60.5.2 `bool Arc::XMLNode::is\_temporary\_` [protected]

This variable is for future
