### 8.54.1 Detailed Description

This class is a client part of HTTP MCC. It accepts PayloadRawInterface payload and uses it as body to generate HTTP request. Request is passed to next MCC as PayloadRawInterface type of payload. Returned PayloadStreamInterface payload is parsed into HTTP response and it's body is passed back to calling MCC as PayloadRawInterface. Attributes of request/input message of type HTTP:name are translated into HTTP header with corresponding 'name's. Special attributes HTTP:METHORD and HTTP:ENDPOINT

specify method and URL in HTTP request. If not present method and URL are taken from configuration. In output/response message following attributes are present: HTTP:CODE - response code of HTTP HTTP:REASON - reason string of HTTP response HTTP:name - all 'name' attributes of HTTP header.

### 8.55.1 Detailed Description

This class implements MCC to processes HTTP request. On input payload with PayloadStreamInterface is expected. HTTP message is read from stream and its body is converted into PayloadRaw and passed to next MCC. Returned payload of PayloadRawInterface type is treated as body part of returning **PayloadHTTP** (p. 59). Generated HTTP response is sent through stream passed in input payload. During processing of request/input message following attributes are generated: HTTP:METHOD - HTTP method e.g. GET, PUT, POST, etc. HTTP:ENDPOINT - URL taken from HTTP request ENDPOINT - global attribute equal to HTTP:ENDPOINT HTTP:RANGESTART - start of requested byte range HTTP:RANGEEND - end of requested byte range (inclusive) HTTP:name - all 'name' attributes of HTTP header. Attributes of response message of HTTP:name type are translated into HTTP header with corresponding 'name's.

### Public Member Functions

### 8.63.1 Detailed Description

This class is MCC implementing TCP server. Upon creation this object binds to specified TCP ports and listens for incoming TCP connections on dedicated thread. Each connection is accepted and dedicated thread is created. Then that thread is used to call process() method of next MCC in chain. That method is

passed payload implementing PayloadStreamInterface. On response payload with PayloadRawInterface is expected. Alternatively called MCC may use provided PayloadStreamInterface to send it's response back directly. During processing of request this MCC generates following attributes: TCP:HOST - IP address of interface to which local TCP socket is bound TCP:PORT - port number to which local TCP socket is bound TCP:REMOTEHOST - IP address from which connection is accepted TCP:REMOTEPORT - TCP port from which connection is accepted TCP:ENDPOINT - URL-like representation of remote connection - ://HOST:PORT ENDPOINT - global attribute equal to TCP:ENDPOINT

## 8.66 Arc::MCC\_TLS\_Service Class Reference

```
#include <MCCTLS.h>
```

Inheritance diagram for Arc::MCC\_TLS\_Service:

### 8.66.1 Detailed Description

This MCC implements TLS server side functionality. Upon creation this object creates SSL\_CTX object and configures SSL\_CTX object with some environment information about credential. Because we cannot know the "socket" when the creation of MCC\_TLS\_Service/MCC\_TLS\_Client object (not like **MCC\_TCP\_Client** (p. 56), which can creat socket in the constructor method by using information in configuration file), we can only creat "ssl" object which is binded to specified "socket", when **MCC\_HTTP\_Client** (p. 52) calls the process() method of **MCC\_TLS\_Client** (p. 57) object, or **MCC\_TCP\_Service** (p. 56) calls the process() method of **MCC\_TLS\_Service** (p. 58) object. The "ssl" object is embeded in a payload called PayloadTLSSocket.

The process() method of **MCC\_TLS\_Service** (p. 58) is passed payload implementing PayloadStreamInterface and the method returns empty PayloadRaw payload in "outmsg". The ssl object is created and bound to Stream payload when constructing the PayloadTLSSocket in the process() method.

During processing of message this MCC generates attribute TLS:PEERDN which contains Distinguished Name of remoote peer.

### 8.68.1 Detailed Description

This class implements parsing and generation of HTTP messages. It implements only subset of HTTP/1.1 and also provides an PayloadRawInterface for including as payload into Message passed through MCC chains.

### 8.68.2 Constructor & Destructor Documentation

#### 8.68.2.1 Arc::PayloadHTTP::PayloadHTTP ( PayloadStreamInterface & *stream*, bool *own* = *false* )

Constructor - creates object by parsing HTTP request or response from stream. Supplied stream is associated with object for later use. If own is set to true then stream will be deleted in destructor. Because stream can be used by this object during whole lifetime it is important not to destroy stream till this object is deleted.

#### 8.68.2.2 Arc::PayloadHTTP::PayloadHTTP ( const std::string & *method*, const std::string & *url*, PayloadStreamInterface & *stream* )

Constructor - creates HTTP request to be sent through stream. HTTP message is not sent yet.

#### 8.68.2.3 Arc::PayloadHTTP::PayloadHTTP ( const std::string & *method*, const std::string & *url* )

Constructor - creates HTTP request to be rendered through Raw interface.

#### 8.68.2.4 Arc::PayloadHTTP::PayloadHTTP ( int *code*, const std::string & *reason*, PayloadStreamInterface & *stream* )

Constructor - creates HTTP response to be sent through stream. HTTP message is not sent yet.

#### 8.68.2.5 Arc::PayloadHTTP::PayloadHTTP ( int *code*, const std::string & *reason* )

Constructor - creates HTTP response to be rendered through Raw interface.

### 8.68.3 Member Function Documentation

#### 8.68.3.1 virtual const std::string& Arc::PayloadHTTP::Attribute ( const std::string & *name* ) [virtual]

Returns HTTP header attribute with specified name. Empty string if no such attribute.

#### 8.68.3.2 virtual void Arc::PayloadHTTP::Attribute ( const std::string & *name*, const std::string & *value* ) [virtual]

Adds HTTP header attribute 'name' = 'value'

**8.68.3.3** `virtual const std::multimap<std::string,std::string>& Arc::PayloadHTTP::Attributes ( void ) [virtual]`

Returns all HTTP header attributes.

**8.68.3.4** `virtual void Arc::PayloadHTTP::Body ( PayloadRawInterface & body, bool ownership = true ) [virtual]`

Assign HTTP body. Assigned object is not copied. Instead it is remembered and made available through Raw interface. If 'ownership' is true then passed object is treated as being owned by this instance and destroyed in destructor.

**8.68.3.5** `virtual bool Arc::PayloadHTTP::Flush ( void ) [virtual]`

Send created object through associated stream. If there is no stream associated then HTTP specific data is inserted into Raw buffers of this object. In last case this operation should not be repeated till content of buffer is completely rewritten.
